THE "MONOPOL" Fire Extinguisher

FOR MANSIONS, PRIVATE HOUSES, HOTELS, HYDROS, RESTAURANTS, CLUBS, PUBLIC INSTITUTIONS, &c.

MADE IN VARIOUS SIZES.

Light and Portable. The smallest size, which contains Five Gallons, is particularly suitable for extinguishing small outbreaks of Fire. Larger sizes, containing Eight, Ten, and Twelve Gallons, are particularly adapted for Public Institutions, &c. The general appearance of the "MONOPOL" is artistic and strongly built and not likely to get out of order. Architects are invited to specify the "MONOPOL" for the above purposes.

PRICES AND PARTICULARS ON APPLICATION TO

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

[Telegrams:—"Robert Adams, London."]

No. 295. Special thrust motion room section Bolt suitable for very narrow stile. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

NEW ROSS.—July 12.—For Building National School. Mr. Walter G. Doolin, M.A., Architect, 20 Ely Place, Dublin.

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,

BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

TRADE NOTES.

WE understand that Messrs. Wm. Potts & Sons have been entrusted with the order to make and erect the new four-dialled illuminated turret clock for the Leeds new post office. The clock is now in hand, and will be fixed as soon as the building is ready for it.

THE new Board Schools, Poppleton, York, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE are informed by Messrs. Dowson, Taylor & Co., Limited, that they have just been awarded the gold medal at the International Exhibition now being held in Vienna for their "Grinnell" sprinkler, with valves and system complete. The award is for practical efficiency and merit.

WE hear that Messrs. S. McKnight & Co., shipbuilders, Ayr, have just launched from their yard a 700-ton screw steamer, built to the order of Messrs. S. & P. Hutchison, Glasgow, for the general carrying trade between Glasgow and France, which is now almost entirely in the hands of that firm. Dimensions:—Length, b.p., 190 feet; breadth, 27 feet; depth, moulded, 14 feet. She has a long bridge poop and topgallant forecastle, and has been built under special survey to class 100 A1 at Lloyd's. The machinery, which is triple-expansion, will be supplied by the eminent firm of Muir & Houston; cylinders, 17 inches, 27½ inches, and 44 inches diameter by 33 inches stroke; boiler, 14 feet 9 inches diameter by 10 feet 3 inches long, working pressure 160 lbs. This steamer, which is being specially constructed by the Messrs. Hutchison to meet the pressing demands, is designed to attain a high rate of speed and is provided with all the latest improvements, including Baird, Thompson & Co.'s improved system of mechanical ventilation, specially adapted for the trade in

which she is to be employed. She is also provided with every facility for the efficient loading and discharging of cargo. On leaving the ways the vessel was named *Juno* by Miss Hutchison, of Lilybank Terrace, Hillhead.

THE tender of Messrs. Worth, Mackenzie & Co. has been accepted by the Hereford Town Council to put in new machinery at the waterworks. The total cost of the work is put at 3,800*l.*

THE North British Railway Company have given the contract for widening the line from the Waverley Station to Abbeyhill, and forming a new tunnel under the Calton to Messrs. Watt & Wilson, Glasgow. The cost will be between 50,000*l.* and 55,000*l.*

THE Cleethorpes Local Board have accepted the tender of Mr. Thomas Smart, of Nottingham, amounting to 4,007*l.* 7*s.*, for laying iron pipe outfall sewer and alterations to sewers in town. The engineer to the scheme is Mr. W. H. Radford, C.E., of Nottingham.

MR. J. W. PALMER, foreign stamp merchant, 281 Strand, London, W.C., has issued a medal; struck by him in commemoration of the opening of the Bascule Tower Bridge by the Prince of Wales on June 30, 1894. The medal is one of the Commemorative Series issued by Mr. Palmer.

THE markets committee of the Leeds Corporation have decided to remove the present Fish Market from Kirkgate to the Hay and Straw Market in York Street. Seven tenders for carrying out the work have been received, and it was decided to accept the tender of Messrs. Cross & Carter, of Bowman Lane, at about 3,000*l.*, subject to the approval of the Council. The materials of the present building will be used for inside work in the construction of the new market, but there will be an entirely new roof, the old roof having been sold.

THE Tees Conservancy Commissioners have made arrangements with Messrs. Bolckow, Vaughan & Co., Limited, the Clay Lane Iron Co., Limited, and the Cargo Fleet Iron Co., Limited, for the reclamation by these firms of nearly three hundred acres of the foreshore at Cargo Fleet and Eston. This will be effected by tipping slag, which these companies will pay for at the rate of 2*d.* per ton, this being divided into three moieties, viz. one-half to the Commissioners, one-fourth to the frontagers, and one-fourth to the Woods and Forests Department. By this means another great improvement will be effected on Tees-side, for the land which is thus reclaimed will be available for the erection of large works on the south bank of the Tees.

HEWETSONS, Tottenham LONDON, W

Court Road, HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (M. PANTON)—"You can find all the furniture at Hewetsons', or if you dubious of your own powers, you could either send me the price catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

BUILDING AND BUILDERS.

At the meeting of the Edinburgh Dean of Guild Court, seven warrants were granted. Among these was leave to Archbishop Angus Macdonald and others to make extensive alterations on St. Mary's Roman Catholic Cathedral, Broughton Street. It is proposed to remove the priests' house at the west end of the church and to place the chancel there, with vestries on the north side and a subway leading to the property No 61 York Place. Recently the administrator, the Rev. Canon Donlevy, was presented with a peal of bells which some years ago hung in St. Giles' Cathedral, and it is now intended to erect a tower for them at the north-east corner of the church, adjoining Broughton Street and Chapel Lane. There will be a baptistry at the south-west corner. It is further proposed to take down and re-erect the choir gallery in the church. The architects for the work are Buchanan & Bennett, 24 George Street.

THE commemoration stone of the New Grand Theatre for Wolverhampton has been laid in Lichfield Street. The front elevation will be of stone and brick and will be 123 feet long; the depth of the building, which will face Berry Street in the rear, will be 122 feet. The dimensions of the interior are stated as auditorium, 70 feet wide; pit, from curtain line to back wall, 58 feet; depth of stage from curtain line, 41 feet 6 inches; and width of ditto, 65 feet 6 inches; proscenium opening, 35 feet; height from pit floor to centre of ceiling of auditorium, 39 feet; height from stage floor to gridiron, 55 feet. The structure is being erected by Mr. H. Gough, Wolverhampton, from designs by Messrs. C. T. Phipps & Son, architects, London.

The reconstruction of St. Werburgh's Church, Derby, has just been completed from the designs of Sir Arthur Blomfield at a cost of nearly 14,000l.

AT Grimsby a site of 11,000 square yards has been offered on a 99 years' lease for the erection of a public free library

and a technical school, and it is stated that with the sanction of the Local Government Board the lease will be accepted.

AT the meeting of the Liverpool School Board it was resolved to purchase from the Earl of Derby, at a price of 20l. per square yard, a piece of land in Sir Thomas Street (containing 361 square yards, for the purpose of building suitable offices for the board.

IT is proposed to erect a new grammar school in the High Street, Dudley, owing to the unsuitability of the present school building in King Street, and the defects of its structural arrangements, as well as to the lack of sanitary appliances.

THE Birmingham City Council passed a resolution authorising the public works committee to borrow 5,200l. for the erection of stabling and other buildings at the Corporation Wharf at Harborne. Mr. Bayley asked whether the plans were prepared in the office, or had the services of an architect been engaged. Alderman Cook remarked that there was a strong and growing feeling in the direction of engaging professional architects for buildings of any importance. Mr. Smith said that the plans had been prepared at the Council House, but in future the committee would engage skilled architects for preparing plans of any importance.

OWING to the death of the managing partner, Mr. David Kinnear, Messrs. Kinnear, Moodie & Co., the contractors for the Leith new dock works, ceased operations, after the work had been in progress for some months, and the contract was eventually secured by Mr. John Best, Edinburgh. Since that time Sir Alexander Rendall, advising engineer to the Dock Commission and arbiter between the parties, has had under consideration the amount of work done, and has now issued his award which, it is understood, is that the trustees of Messrs. Kinnear, Moodie & Co. should receive the sum of 8,000l. from the Commissioners for the harbour and docks for the work done and the plant laid down on the ground. Messrs. Kinnear, Moodie & Co. lose several thousand pounds; but according to the conditions stipulated in the contract, the Dock Commission claimed the right to take over without payment the completed work and plant in the event of the contract being broken.

AT the meeting of the Ripon City Council it was proposed that a sum of 14,000l. should be borrowed to carry out the sewage purification works and intercepting sewers, and 300l. for Princess Road sewer, and that the proposed renewal of street sewers should be deferred, but an amendment was carried,

"That 19,000*l.* be borrowed, to include, in addition to the above, renewal of sewers in various parts of the city.

At the monthly meeting of the Hereford Town Council payment was ordered to be made to the Ecclesiastical Commissioners of 2,000*l.* for the purchase of the land at Bartonsham for the extension of the sewage outfall works.

THE death is announced of Mr. John Whittaker, a well-known St. Helens builder and contractor. Mr. Whittaker was seventy years of age, and although brought up in Manchester had spent the last forty years in St. Helens. Mr. Whittaker among other buildings in the town had erected the Corporation baths at Boundary Road and the new softening works at Nutgrove.

At the meeting of the Keighley Board of Guardians two schemes for enlarging and improving the washhouse and laundry accommodation were submitted by the architect, Mr. Moore, at a cost of 530*l.* and 150*l.* respectively. The opinion was expressed by several members that, taken together with the enlargements at the infirmary, the carrying out of this extension would render unnecessary for fifteen or twenty years the suggested rebuilding of the workhouse, which latter would probably mean an outlay of 16,000*l.*

VARIETIES.

AMONG private Bills, Lord Portman's committee has just passed the County Council General Powers Bill, which authorises them to contribute 6,000*l.* for the extension of Paddington Recreation Ground, and also gives further powers in preventing the introduction of hot water and refuse into the sewers. In relation to the latter subject the committee decided that the Marylebone Vestry were still to be allowed to get rid of their snow by means of the sewers so long as it was free from road detritus, and also prohibited the brewers from putting in hot water above 110 degrees Fahrenheit, but postponed the operation of this clause for a year to enable the trade to make other arrangements than those now in operation.

The annual beanfeast of the employes of Messrs. Braby & Co., engineers, of the Fitzroy Works, Euston Road, London, took place on Saturday at Bognor. The party, which numbered between sixty and seventy, arrived about 11.30 A.M. A cricket match, Married *v.* Single, was engaged in on the sands; and at two o'clock the company sat down in the small hall of

the Assembly Rooms to dinner, Mr. N. Sherson presiding. During the afternoon drives were arranged to Chichester, Goodwood and the now celebrated Jubilee Stamp Room at North Bersted. The party returned to town at 7.50 P.M.

IT is intended to erect villas of from 40*l.* to 60*l.* a year on sites adjoining the barracks at Chichester.

THE Liverpool city engineer has been instructed to make arrangements for the lighting of Lime Street throughout with incandescent gas burners, the present lighting power being maintained.

AT Alexandria a new channel to the harbour, 28 feet in depth, has just been officially opened. Vessels will now be able to enter the port of Alexandria by night as well as by day.

THE almost immediate publication of the "Photography Annual for 1894," edited as usual by Mr. Henry Sturmy, is announced by Messrs. Iliffe & Son.

THE Glasgow Corporation has taken over the direct control of the city tramways. The project has so far involved an outlay of nearly 300,000*l.* for building purposes, new plant, &c., and further expenditure is yet to be anticipated ere satisfactory working can be attained. The new cars are an immense improvement on the old, being pronounced by experts to be models of perfection of their kind.

At the monthly meeting of the Clyde Navigation Trust it was agreed to proceed with the hydraulic installation building at Cessnock Dock, at a probable cost of 11,600*l.*, and alterations in the hydraulic installation at Queen's Dock at an estimated cost of 4,100*l.*

THE Guiseley Local Board intend to apply to the Local Government Board for sanction to borrow 10,000*l.* for the purpose of purchasing the works and plant of the Guiseley Waterworks Company. The amount includes 1,500*l.* for a new reservoir and nearly 500*l.* for the renewal of pipes.

At the meeting of the Birmingham School Board, the sites and buildings committee will recommend that about 2,000 square yards of additional land be purchased to enlarge the site of the school in Chandos Road, Moseley Road, and that the schools in Dixon Road and Montgomery Street be enlarged by the addition of class-rooms.

At the meeting of the Lynn Town Council the special committee on municipal buildings brought up a report recommending the erection of a suite of new rooms at the cost of 4,000*l.* The report was adopted.

ESTABLISHED 1869.

THE death is announced of Mr. D. Clack, building surveyor, of Lynn. Mr. Clack came to Lynn as clerk, &c., to Mr. Charles Bennett, builder, then in a large way of business, and subsequently entered into partnership with Mr. R. Dye, upon Mr. Bennett's retirement from Lynn, and the firm executed a number of public works. After the dissolution of this partnership, Mr. Clack practised as surveyor, and entered the Town Council for the South Ward, being at that time a popular man, through the independent line he took in relation to the management of the docks and other local matters.

At the meeting of the Cheltenham Town Council Mr. H. Kilgour was appointed electrician to the Town Council at a salary of 200*l.*, rising to 250*l.* Messrs. Malvern's tender at 1,799*l.* was accepted for the erection of the central electric-lighting station. The tender of Callender's Bitumen Telegraph and Waterproof Company at 1,031*l.* 8*s.* 4*d.* was accepted for the supply of cables, subject to those for the high-pressure ones being guaranteed for ten years.

THE LONDON AND NORTH-WESTERN RAILWAY COMPANY.

GREAT improvements have just been made at the Willesden Junction and Euston stations for the London and North-Western Railway Company, largely facilitating passenger and vehicular traffic. At the former station alterations and additions comprise new railway bridge for Broad Street trains, together with platforms, waiting and refreshment rooms, booking-halls, &c.; approach incline from Harlesden Road to low level platform; iron footbridge for passenger traffic and additional bay to Harrow Road bridge; about 1,000 tons of iron and steel have been used in these works. At Euston a steel bridge 150 feet by 26 feet has been erected, together with approach roadway on massive brick viaducts, for the purpose of taking the milk and parcels traffic; this work necessitated the raising of the roof bodily the whole length of the bridge, and also some very heavy shoring under the existing buildings while inserting girders, which could only be carried out under difficulty owing to the immense weight to be supported. New offices, platforms and the general reconstruction of a large portion of the station has been effected. The whole of this work has been carried out without hitch or inconvenience to the traffic, at a cost of about 60,000*l.*, by the

contractors, Messrs. Kirk & Randall, of Woolwich, who have completed the works at Euston in the extraordinarily short space of twenty weeks.

A UNIQUE SALE.

TO-MORROW (Saturday) a private view will be held of objects to be sold by auction by Messrs. Hampton & Sons, of 1 Cockspur Street, S.W. The objects to be sold consist of the valuable and unique contents of No. 28 Ashley Place, Victoria Street, S.W., the property of Mrs. Wallace Carpenter, embracing rare specimens of Moorish, Cairene, Indian, Persian, Oriental and other furniture; carved and beautifully-decorated woodwork, representing Eastern corridors, arches, &c.; curios, draperies, old embroideries, carpets and rugs, being a collection extending over a period of thirty years and gathered together as the fruits of several voyages to Eastern countries, including a magnificent orchestration and a fine-toned harmonium, piano, &c. The auction sale will be held on Tuesday, July 10, and following days at one o'clock, by Messrs. Hampton & Sons. The objects to be sold are comprised under 775 lots. No pains have been spared in preparing the catalogue, which gives a clear and concise description of all objects to be submitted for purchase.

METROPOLITAN WATER SUPPLY.

THE water committee of the London County Council, of which Mr. Bassett Hopkins is chairman, brought up a report to the last meeting of the Council asking for powers to make the necessary preparations for the introduction of one or more bills in the next session of Parliament for the transfer to the Council of the undertakings of the metropolitan water companies, or of such one or more of them as the Council might hereafter determine. Since then the committee have had an opportunity of further considering the matter, and they have come to the conclusion that it would be better to go to Parliament for powers to acquire the properties of all the companies, but to proceed by means of a separate bill for each company; they therefore recommend that eight separate bills be prepared, and the appointment of three members of the water committee to act in conjunction with the Parliamentary Committee in the preparation of the bills, with a view to their introduction in the next session of Parliament.

MUNICIPAL WORKS IN BIRMINGHAM.

THE report of the public works committee of the Birmingham Corporation announces that the sanction of the Local Government Board to the loan for the completion of the Hockley Brook improvement having been given, tenders for the work were obtained by a joint committee of the Aston Local Board and the public works committee, and that of Messrs. Jones & Fitzmaurice, of Birmingham, at the sum of 8,492*l.* 14*s.* 2*d.*, was accepted, and the work is proceeding. The cost will be borne jointly by the two authorities. The committee have accepted the tender of Mr. R. Fenwick, of Birmingham, for the erection of the additional stabling and granary at Holliday Street Wharf authorised by the Council, for the sum of 6,095*l.*, and the work is now being proceeded with. By a minute of the Council the committee were authorised to acquire on a ninety-nine years' lease a piece of land adjacent to the Harborne Railway, as a dépôt for stabling and shedding, storage of materials, &c. The London and North-Western Railway Company have constructed a siding from the Harborne line into the wharf, and the committee, after conferring with the health committee, who will require some of the stabling, recommend that they should be authorised to erect stabling for ten horses, two loose boxes, harness-room, mess-room for men, engine-house and pit for housing and repairing steam road-rollers, &c., with a loft over the stabling, a house for the foreman, and an office. The estimated cost of these works, inclusive of boundary walls, railway siding, construction of roads, paving of yard, weighing-machine, &c., is 5,200*l.*, and the committee recommend that they be authorised to have the buildings erected. With reference to the Council minute referring to the committee a memorial from residents in the vicinity of the tramway terminus in the Old Square, praying that the nuisance occasioned by the execution of repairs to the tram rails by night might be abated, the committee report that these repairs can only be executed at night, except by suspending the traffic; they have, however, with a view to diminishing the inconvenience complained of, given instructions that, as far as is consistent with the proper execution of repairs, the rails shall be cut and prepared before being brought on the spot. The committee having received an application from the Birmingham Central Tramways Company for permission to construct the Bristol Road tramways on the overhead electric-wire system as at Walsall, they visited Walsall, accompanied by representatives

of the company, and inspected the system in operation there. They were of opinion, however, that the system was not one which they could recommend the Council to sanction for adoption on the route named. The lighting of the courts in the city continues to receive attention. During the present year the necessary steps have been taken to provide the proper means of lighting in 500 courts, and instructions have been given to prepare the necessary plans and specifications in respect of 250 more.

THE FORTH BRIDGE.

At this season of the year the painting of the bridge may be seen, the *Glasgow Herald* says, in full operation. During the winter and spring months the weather will not permit of such work being carried on, and it is therefore only during the summer and autumn that it can be accomplished with anything like safety and success. The whole of the structure receives a new coat of paint every three years, and this is carried out in sections, about one-third being undertaken each year. Last summer the northern approach viaduct and the north cantilever were successfully dealt with, and this year the southern approach viaduct and the south cantilever are being treated in a like manner. It is also intended to include the two centre girders in this season's work, which will then leave only Inchgarvie cantilever for next year. Besides the painting, every part of the structure is carefully examined, and loose or defective rivets removed and new ones put in their place. Some idea may be had of the immense quantity of material used in the construction of this bridge when it is mentioned that it requires about 50 tons of paint to cover it, and that the area thus dealt with is something like 120 acres. At the present time about fifty men are employed, and an endeavour is made to retain, as far as possible, the same men upon the work, as it always takes new hands some time to become thoroughly acquainted with their aerial position. At first this work was attended with considerable danger, but very complete apparatus in the shape of small cages has now been provided, so that the men run very little risk even at the highest and most dangerous points. In fact, the present arrangements work so well that for a long time past no accident has been heard of. Notwithstanding that since the bridge was opened about 200 trains have passed over it daily, the tear and wear is as yet almost inappreciable, and the inclinations and deflections quite unchanged.

WARD'S PATENT FIREPROOF, SOUND PROOF, AND VENTILATED FLOOR.

MESSRS. B. WARD & Co., of 15 Great George Street, Westminster, have brought out a new patent fireproof floor, using an old fireproof material, viz. gypsum, in a new way. Cellular slabs are made of the material with a piece of bar iron in it. By this means they are able to make the lintels much larger and stronger and lighter than in fireclay; there is no waste in the manufacture, and a true level ceiling is at once secured.

Less iron is also necessary, and a thoroughly-ventilated air-space is provided between the ceiling and the ironwork. The conductivity of gypsum is less than one-half of fireclay. They also provide for thoroughly protecting the constructional girders, which is of the utmost importance when a fireproof floor is required. Special slabs for walls on the splay can be quickly manufactured, and if necessary the whole of the slabs may be made on the job and at once fixed. A very light and thin fireproof floor can be constructed in this manner. They also show in their new catalogue fireproof slabs for stanchions,

columns, &c., as also a very simple method of curing damp walls and floors in basements, &c. Architects should certainly see their new catalogue for some decided improvements in buildings. The testimonials on the back of the catalogue from such men as Mr. R. Norman Shaw, R.A., Mr. Aston Webb, F.R.I.B.A., Mr. E. R. Robson, F.S.A., and Mr. Spencer Chadwick should be a sufficient guarantee that Messrs. B. Ward & Co. do good work.

THE TOWER BRIDGE.

THE Tower Bridge is, and ought to be, a great work, for it will have cost, before all is finished, about 1,170,000*l.*, and to keep it in good condition and working order, with a proper staff of police and attendants, somewhere between 6,000*l.* and 8,000*l.* a year will be required. Brand new as the bridge stands to-day, it has in a sense sprung out of a very remote past, for the money that has built it has been yielded by the Bridge House Estates, with which Old London Bridge was originally endowed somewhere about the time of Thomas à Becket, with whose memory the first bridge was associated. The original idea of it was struck out by the late Sir Horace Jones—when he was Mr. Horace Jones—the City architect, who seems to have taken a hint from the bascule bridges of the old feudal fortresses, and to have aimed at harmonising his new structure with the hoary old Tower of London close by. Although it is new, it thus seems to be closely linked with the past, and it stands with its roots thrust deep down 15 feet into the hard, solid rock-like London clay. They reach down 27 feet under the bed of the river and 60 feet down below Trinity high-water mark. They were formed by slowly sinking down enormous steel caissons—huge cylinders weighing altogether a thousand tons, dropped down end foremost. The water was pumped out of them and the river bed dug away from beneath them until their own weight carried them down to the necessary depth in the London clay, and then they were filled in with concrete and built round with brick and granite; and so the foundations were laid big enough for the piers, each 205 feet long and 100 feet in width, and solid enough to bear the full weight of the vast superstructure, somewhere about 70,000 tons.

The two piers are 200 feet apart, and upon each of them were built up four columns of steel, $5\frac{1}{2}$ feet in diameter and 120 feet high. These four columns on each pier, connected by

massive girders, constituted a steel tower of tremendous strength, but also of great ugliness, and two of them have been masked by handsome Gothic buildings of granite. The beautiful stone towers, however, are only for show. It is beauty only skin deep, and it is the ugly steel towers within them that constitute the main supports of the suspension bridges on either side the river and the two high-level girder-bridge footways across the middle. It is these steel towers that sustain the tremendous weight of the "chains" and the bridges at the top, the ornamental stonework standing around them quite unconnected. The "chains" are anchored deep in the bank on either side the river, pass over the handsome abutment towers forming the entrance to the bridge, sweep in a vast curve down nearly to the road level, and then upwards to the summit of the central towers, where they are connected with the ends of the high-level girders spanning the central 200 feet. Thus the suspension bridges pull one against the other across the central gap, keeping the lofty footways fixed and rigid. These side suspension bridges are, of course, fixed. They are at just about the same level as London Bridge, and they give just about the same headway at high-water as is given by the central arch of that structure—29 feet 6 inches, that is to say. They each have a span of 270 feet.

In all this there is nothing new or very remarkable in any way, except the great scale of the work. It is really an enormous structure—much larger than it looks indeed. From the bottom of the foundations to the top of the gilded grills, the central towers are 293 feet high, or about the height of the golden gallery of St. Paul's above the pavement below. The elevated footways are over 140 feet above high-water mark. The bridge and its abutments are 940 feet long, and with the approaches, which add 1,700 feet, the entire length of the work is just about half a mile. Nearly 16,000 tons of iron and steel have been employed in it, and 20,000 tons of cement. There are 31,000,000 of bricks embedded in it, and 415,000 cubic feet of stone of one sort and another. Londoners have certainly got a considerable amount of material for their money, and a vast amount of good sound honest workmanship, to say nothing of the very best engineering skill of the day, steadily labouring away for eight long years.

But the extremely interesting feature of this really great work are the lifting bascules. They are quite unique. Nothing in their way at all equal to them is to be seen anywhere in the world, and to be near them in action is to witness one of the most imposing displays of

CASES FOR BINDING THE ARCHITECT

Price Two Shillings.—Office: 175 Strand, London, W.C.

hydraulic power that even Sir William Armstrong and his company have ever yet afforded. Many thousands of Londoners have already become familiar with them, though comparatively few have seen them in action. In their horizontal position they present a broad expanse of wood-block roadway 200 feet long and 50 feet broad, and weighing 2,400 tons. Beneath them there is a clear headway of nearly 30 feet, so that all the smaller craft of the river can readily pass under them even at high water, and will have a waterway of 200 feet. While they are down the new bridge will present a fine level roadway from end to end, and abundant space for pedestrians and vehicles. Larger vessels requiring to pass up or down the river, however, will of course require more headway, and on the approach of one of them the low-level way will be barred by a chain drawn across the bridge. Vehicles will have to pull up for awhile, and the stream of pedestrians will be turned into the great towers to reach the high-level footways either by the winding staircases of 170 or 180 steps, or by the hydraulic lifts, of which there are two in each tower—small rooms 14 feet by 5½ feet, and 9 feet from floor to ceiling—capable of taking five-and-twenty or thirty people up and down five-and-twenty times an hour. While the foot passengers are thus being hoisted aloft the machinery of the bridge will itself tighten the chain, thus affording a rigid, impassable barrier. Until this has been done that same machinery will render it impossible to raise the bascules. The instant the chain is in position and drawn tight across the road, however, the man in the little glass cabin on the southern pier at its eastern end will find a lever yield to his pull, though previously immovable. The lever comes over, and the great bascules—each of them presenting a surface of 5,000 square feet of seemingly solid roadway and footpaths—will rise into the air and fall back perpendicularly against the towers. The big ship with her masts, it may be at their full height, will pass through. Another lever will be drawn, and the bascules will fall swiftly and silently, rise and fall having occupied just about one minute, though it is estimated that the control of the traffic and the working of the bridge will average about five minutes. When, however, the tide is within a couple of hours or so of high water, and vessels come thick and fast, it is expected that the bascules may be kept open for a quarter of an hour or twenty minutes at a time. The machinery by which these ponderous trapdoors are raised and lowered and the lifts run up and down in the central towers is hydraulic.

Over on the Surrey side there is a structure of yellow brick

—bald and ugly and obtrusive—a striking detraction from the beauty of the fine Gothic structure to which it is subsidiary. This is the original source of power. The approach to the bridge is built on a series of arches, and under two of these arches are four steam boilers 30 feet long. Another of the arches is a coal store, and two others contain the splendid pumping engines by which water is forced into the hydraulic accumulators under a pressure of 700 lbs. to the square inch. From these accumulators two 6-inch steel mains run along to the hydraulic machinery concealed in the heart of the granite piers in the middle of the river. Solid as they look, both these piers are, internally, wonderfully intricate mazes of mechanism, half of which, however, as it has been explained, is only a reserve in case of emergency. Down below the machinery are the accumulator chambers, while above are the little glass cabins from one of which the whole vast mechanism will be worked, the other three existing merely for the sake of uniformity of appearance. This cabin overlooks the bascules, and is in telephonic communication with every other part of the works. It has something of the appearance of a railway signal-box, with its gauges, its telephone box and its double row of levers. Great as is the power it commands here, the actual exertion of it on the ponderous bascules is but small, for though each weighs complete something like 1,200 tons, each is swung on a steel pivot 2½ feet in diameter, and counterpoised by 300 tons of lead and 130 tons of iron. They thus are so nicely adjusted that a very small portion of the hydraulic force it commands hoists the huge bascules into the air or brings them down again to the level. The application of the power simply means letting a little cold water into the tangle of machinery down at the feet of the towers. This sets in motion a couple of cog-wheels, which work in a rocked quadrant at the back of the bascule. As these small cog-wheels run round the quadrant in one direction, the bascule falls; as they are reversed and run back again it rises. The principle of the thing is simple enough, but the mechanism by which it is all carried out looks to be wonderfully complicated and intricate. There are two pumping engines, each of 360 horse-power, eight large hydraulic engines and six accumulators.

This great and important work urgently demanded for so many long years was finally decided on in October 1884, and excavations were actually commenced in May 1886, and the memorial-stone was laid by the Prince of Wales on June 21 following. It has thus been in hand just about eight years. This is far in excess of what was originally considered would

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the hole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

be necessary, and the cost of it has also been much heavier. I cannot be said, however, that time and money have not been well expended. The convenience of it will no doubt be immense, and as a public work it is well worthy of its prominent position as the one entrance to London from the sea. The late Sir Horace Jones—who by the way nearly met his death at the ceremonial stone-laying by the falling of a part of one of the machines in use—designed the bridge in co-operation with Mr. Wolfe Barry, C.B., as engineer. Upon the death of Sir Horace Jones the mantle of the architect fell upon the shoulders of Mr. G. D. Stevenson, formerly his assistant, Mr. Barry still being engineer, with Mr. G. W. Crutwell resident engineer. Various portions of the work have been entrusted to several contractors. Mr. John Jackson did the foundations and the northern approach. The southern approach was entrusted to Mr. W. Webster. The iron and steel have been supplied by Sir William Arrol & Co., the masonry of the towers has been the work of Messrs. Perry & Co., and the hydraulic machinery has been supplied by Sir William Armstrong & Co.

There are still other firms who have the privilege of their names being associated with this grand work.

On the four sides of the two abutment towers are to be seen perhaps the largest productions of the City arms ever executed in stone, but there is one still larger in the centre of the upper span or bridge, produced in iron and decorated, the model for which, together with the whole of the carving, was executed by Mr. C. H. Mabey, sculptor, Westminster; also the royal arms upon the foundation-stone.

The bridge and its approaches are lighted entirely by gas, with brilliant effect, upwards of 200 of Sugg's high-power gas-lamps being used for this purpose. The various arrangements made for the illumination by night of this huge water-gate of London constitute a most important installation of public lighting. On the north approach (City side) there are about forty large hexagonal gas-lamps, all fixed upon handsome cast-iron standards mounted on the parapets. The shore spans and south approach are lighted by similar lamps elevated upon ornamental cast-iron columns erected at the edge of the kerb. The lighting of the opening span is provided for by means of four lamps of special construction, each having an effective illuminating power of 400 candles. These are suspended from massive iron brackets of handsome design fixed on the navigation sides of the north and south towers. It is worthy of mention that all the columns and brackets for the lamps have

been cast to the special designs of Mr. G. D. Stevenson, A.R.I.B.A. The result is that the lighting arrangements serve an additional purpose which is too often lost sight of, by helping to beautify the structure upon which they are placed. The engine and boiler-rooms, the machinery chambers on the piers, the bascules, accumulator-chambers, staircases, lifts and high level footways are all lighted in a very effective manner, and in many cases the lamps have been specially constructed to suit the positions they now occupy. On both sides of the bridge large gas meters are fixed, and the mains are so arranged that in the event of its being necessary at any time to stop the supply on either side, the gas for that side of the bridge may be obtained from the other. Some eighteen months ago, just after the gas work was commenced, temporary supplies were laid on over the bridge, towers, &c., and lights fixed to facilitate the work of building and to prevent accidents as far as possible. It is not uninteresting to know that these temporary supplies have been gradually removed as the permanent mains were run, without once stopping the supply of gas to any part where light was required.

The whole of the gas work has been carried out by William Sugg & Co., of Westminster, who have also supplied the water mains and supplies throughout, and the hydrants, tanks and hand-pumps in connection therewith. We may mention that the work has been personally superintended by Mr. William Sugg, assisted by Mr. John Worsfold, upon whom the task of carrying out the work has largely devolved.

The whole of the staircases in the towers have been fitted with Mason's patent unwearable non-slipping treads supplied by the Safety Tread Syndicate. The wood blocks have been executed by the Acme Wood-block Flooring Company, Limited, on Duffy's system. The patent stone of the Victoria Stone Company has also been largely used.

There are still a good many odds and ends of work remaining to be done, and the full Parliamentary time allowed for its completion, extending up to August, will probably elapse before all can be finished. But for all practical purposes the work is complete. The ceremony on the opening day was a great success, and the glorious weather, it must be admitted, added the crowning adornment to a brilliant pageant. It is understood that the bridge will be open to the public on Monday.

THE Birmingham Corporation intend to appoint a principal for the technical school at a salary of 500*l.* a year.

MINERAL ROCK ASPHALT.

A VISIT has just been paid to the works of the Limmer Asphalte Paving Company, Limited, Leamouth Wharf, Blackwall, by members of the Incorporated Association of Municipal and County Engineers, when Mr. Blake read the following short paper:—The uninformed mind regards all tar paving, British asphalt and similar compositions as asphalt, and believes them to be practically the same thing as rock asphalt. This is a great mistake, and the result is frequently that because these materials are laid for asphalt and fail in the winter to stand the cold and in the summer to stand the heat, 'rock asphalt' is condemned. Rock asphalt, however, is a totally different material, it has nothing whatever to do with gas tar and similar materials, and will not amalgamate with them. Rock asphalt is a natural product—a limestone rock impregnated with bitumen—and is found in Limmer and Vorwohle in Germany, in Switzerland, France and Sicily. For compressed work this company's supplies are taken from Ragusa in Sicily, and for mastic work from Germany. It is quarried in the same manner as other minerals, and brought to England in its natural state as you see all round you. The process of manufacture of compressed asphalt for carriageways, &c., is as follows:—The pieces of raw rock weighing from $\frac{1}{4}$ to $\frac{1}{2}$ cwt. are placed into the "crusher," where they get broken to the size of walnuts. After passing through the crusher the asphalt is carried up by elevators to the disintegrator, which runs at a speed of 1,800 revolutions to the minute, where it is ground to a fine powder. For compressed work this powder is heated in roasters with revolving cylinders to a temperature of about 280 deg. Fahr., and as soon as the superfluous moisture has evaporated the heated powder is placed in iron sheathed vans, covered with cloths and taken to the street where it is to be laid. The powder is then raked over the surface of the street to the thickness required and rammed with hot pelons, smoothed to a polished surface and then rolled with a heavy hand roller. It gradually becomes cold, and in time is compressed into solid rock again by the traffic. The usual thicknesses of compressed asphalt are as follows:—

Carriageways (heavy traffic)	2 inches
" (light ")	1½ "
Laid on a bed of 6 inches of Portland cement concrete.	
Footways	1 inch.
On a bed of 3 inches to 4 inches of Portland cement concrete.	

Compressed asphalt is the most suitable material for carriageway pavements for the following reasons:—Its durability, the rapidity with which it can be repaired, causing no delay to traffic or inconvenience to the public, its great sanitary properties, because being jointless it is readily and easily cleansed, and no vegetable or animal refuse can lodge in crevices and decay. Asphalt, when clean, is not slippery. The only time that horses slip is when a shower of rain is just commencing, then the dirt which has been allowed to remain on the asphalt becomes a little damp and makes a greasy surface for a few minutes until the pavement is thoroughly wet. In Paris the streets are regularly flushed, but there the engineers can get free water direct from the Seine. In London filtered water has to be purchased at present from the water companies.

The uses of mastic asphalt are limitless ; among others the following may be enumerated : footpaths, courtyards, stables, coachhouses, roofs, floors, vertical work to walls, corridors, basements, wine cellars, tennis courts, reservoirs, slaughter-houses, &c. It is manufactured in the same way as the compressed as far as the powder stage, then it is boiled in cauldrons worked by agitators, with a certain quantity of bitumen as flux, and when heated to about 400 deg. Fahr. a proportion of from 10 to 20 per cent. of fine Bridport grit is added and thoroughly incorporated with the asphalt by the agitators ; it is then turned into iron moulds and made into cakes of half a hundredweight each, ready to be sent to any part of the world. These cakes are broken up, put into cauldrons with just sufficient bitumen as a flux, and, when properly cooked, the asphalt is spread over the surface to be covered by means of the hand-floats and then rubbed with fine sand. The bitumen used in the manufacture of mastic asphalt is a most important feature, and its manufacture requires the greatest possible care. The cheaper kinds are made from petroleum refuse, gas tar, &c., but these materials have a deleterious effect on asphalt. The very best bitumen is made from best Scotch shale and refined Trinidad pitch (*épurée*). It is very expensive, but it is of the greatest importance to have it of the best and purest possible quality. By manufacturing this ourselves we can always guarantee our asphalt to stand the extremes of heat and cold. The sanitary advantages of asphalt over every other pavement cannot be overrated. In crowded neighbourhoods, back courts and alleys, where the poorer classes dwell, it is of the greatest importance. The asphalt can be flushed with water at any time, and all impurities, refuse, &c., washed away,

and the pavement is immediately dry again. The London County Council have ordered all slaughter-houses to be paved in this way, as they can then be flushed and made perfectly clean and sweet at once. For footways it is the very best material. While tar paving and all similar compositions require to be constantly renewed, rock asphalt laid 1 inch thick will last from twenty to twenty-five years and longer, according to the nature of the traffic. In the City of London and for the various vestries and district boards of works of the Metropolis this company has laid many hundred thousands of yards of carriageways and footways, which have given entire satisfaction.

After the reading of the paper, questions were addressed on the subject of Trinidad pitch pavement. Mr. Blake explained that many experimental pieces of pavement made with Trinidad pitch and other materials had been laid in the City of London during the last twenty-five years, but they had not proved satisfactory, and had all been replaced by rock asphalt.

After a vote of thanks to Mr. Blake for his paper had been unanimously passed the company inspected the works, with which they expressed their great satisfaction.

A cordial vote of thanks to the directors, which was acknowledged by Mr. Greig, the chairman of the Board, concluded the proceedings.

KESWICK MORTUARY CHAPEL, NORFOLK.

THE old church of All Saints, in this parish, which has been in ruins for upwards of 250 years, Divine service having been last held there in 1602, and its remains principally consisting of part of the round tower, almost surrounded by trees, is now undergoing a partial renovation for the purpose of being used as a mortuary chapel, at the sole cost of Mr. John Henry Gurney, J.P., of Keswick Hall. The restoration will proceed as nearly as possible on the old lines, the principal works undertaken being thorough repair to the tower, including new roof, windows, &c., building new walls to the nave on the old foundations (which, even after a lapse of several centuries, appear on examination to be sound), and covering the nave roof with tiles, &c. The iron railing enclosing the churchyard, which has now been reopened for interments, was erected last year, also at Mr. Gurney's expense. The work to the new mortuary chapel has been entrusted to Mr. J. S. Smith, of 24

City Road, Lakenham, Norwich, under the superintendence of Mr. Herbert J. Green, of 31 Castle Meadow, Norwich, architect and diocesan surveyor.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

11756. Samuel Tomlinson, for "Improved fastener and adjuster for windows and doors."

11770. George Thomas Richardson, for "Improvements in the means of rendering doors, windows, casements and the like dust, draught and waterproof."

11771. John Julia Ridway, for "Improvements in locks and latches."

11786. Samuel Taylor, for "Improvements in casement windows."

11803. Ralph Sibley, for "Improvements in frames of drain traps and the like."

11820. Joseph Thomas Nicholls and Thomas Crooke, for "Improved window-sash holder."

11980. John Lakin and Charles Johnson, for "An improved method for raising and lowering windows in sashes and as a dust and draught excluder, to be used on board ships or in any kind of carriage or elsewhere."

12094. William Barber Press, for "Improvements in stop-cocks and taps."

12098. Eustace Fraser Rawlins, for "An automatic sash-fastener."

12153. George Wheeldon, for "Improved means of securing window sashes."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

VARIETIES.

APPLICATIONS numbering 106 have been received by the electric-light committee of the Coventry City Council for the post of clerk of works for the proposed buildings.

DURING the past eighteen months boring operations have been carried on at Dungannon, Ireland, by Mr. Donald Munro, mining engineer, in search of coal. The work, it is stated, has been brought to a successful issue, a seam of bituminous coal, 5 feet 11 inches in thickness, having been struck. The depth at which the seam was discovered is 188 yards from the surface.

IN connection with the restoration of Bristol Cathedral, Dean Pigou fixed the cap-stone of the central tower.

THE dedication of new bells at Solihull parish church has just taken place. The contract was placed with Mr. James Barwell, who has recast the whole peal of eight bells and added two new ones, bringing the number up to ten. They are hung in a new English oak frame, with cast-iron stanchions, and the ringing chamber has been restored by the local amateur guild. The necessary alterations to the fabric of the tower were carried out under the superintendence of Mr. J. A. Cossins, architect.

THE Leeds City Council have agreed to the expenditure of 18,000*l.* upon the erection of four pavilion hospitals for fever patients on the Manston Hall estate.

AFTER considerable delay the Corporation of Monmouth called in Messrs. Bramwell & Harris to report on the seventeen competitive schemes submitted for the sewerage and sewage disposal of Monmouth. These gentlemen have now awarded the premiums as follows:—The first premium of thirty guineas to Mr. W. H. Radford, C.E., of Nottingham, and the second premium of twenty guineas to Messrs. John Parkin & Son, of Westminster.

A STEEPLE-JACK, Mr. John Freeman, aged thirty-eight, employed by Mr. W. J. Furse, electrical engineer, of Nottingham, was removing some spouting on the steeple of Annesley Church, when he slipped and fell, death ensuing instantaneously.

AT the annual meeting of the Midland Counties Institution of Engineers, held at the Stephenson Memorial Hall, Chesterfield, Mr. G. Lewis, of Derby, presiding, Mr. W. Spencer, Leicester, was elected president.

AMONG those who submitted themselves at the technological examinations of the City and Guilds of London Institute, Mr. S. B. Bennett, in honorary plumber's work, has received first prize of 3*l.* and silver medal.

CURTICE'S *Journal of Information* notices that an International Electrical Exhibition will be held in Paris in 1895, from July 1 to October 1.

THE Midland Railway have found electricity too costly for lighting purposes, so they have started large works at Sheffield for the purpose of manufacturing oil-gas. The oil is to be distilled from shale found in Scotland.

IN the annual report of the Free Libraries Committee it is stated that, in consequence of a gift from Lord Hastings, the Town Council have decided to erect a museum on the space in communication with the reading room, the cost being defrayed out of the Technical Instruction Fund. The plans have been prepared by Messrs. Bottle & Olley, architects, Yarmouth.

THE Tower Bridge was opened for a few hours for pedestrians during this week. It is stated that by Monday next it will be fully open for traffic.

THE Walsall Town Council intend to borrow 12,000*l.* or 13,000*l.* for street improvements and other works.

AN address and silver gilt-casket, designed by Mr. Bentley, architect, has been presented to Sir Stuart Knill, Bart., who has done so much in aid of the registration of plumbers, to commemorate his year of office as Lord Mayor.

WE regret to have to record the death of Mr. George Calvert, who died at his residence, Verulam House, Wandsworth, on July 2, from the effects of a paralytic stroke. Mr. Calvert was son of the late Mr. William Calvert, of Islington, and was born March 26, 1836. Mr. Calvert was for about thirty years in the firm of Hobbs, Hart & Co., Limited, lock and safe manufacturers, of Cheapside, and for many years their manager. He had been in failing health for a year or more, and had been confined to his house for about two months. The funeral took place at Wandsworth Cemetery on July 5; there were many of his friends present to hear the last sacred rites read. The mourners were Mrs. Calvert (widow), G. E. Calvert, W. F. Calvert and A. T. Calvert (sons), Miss Calvert (daughter), Mr. Thos. Calvert and Mr. Alfred Calvert (brothers), Mr. A. Freeman (brother-in-law), Dr. Greene, Mr. John Coates, Miss Freeman, Mrs. A. Calvert and Mrs. A. Freeman. The coffin was polished oak with brass furniture, and was completely covered with wreaths.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the prettiest catalogue to mark, or my daughter could choose them next time she is in town if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c. —DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

ARCHITECTS' Plans and Designs exactly and faithfully worked to.

Tenders Free for ELECTRIC LIGHTING.

SANITARY Work, STRUCTURAL Alterations, and every kind of Interior & Exterior DECORATIONS.

Without Drawer and Pigeon-holes on Top, £10 10*s.*

TRADE NOTES.

At the London Sheriff's Court, Mr. Chewoneth obtained 50*l.* damages for personal injuries sustained through falling over a coal-hole plate in Nelson Street, City Road. It is to be hoped that safety coal-plates will be adopted universally.

At Kirby Moorside parish church, Yorkshire, a fine new clock has just been erected through the generosity of the Right Hon. the Earl of Feversham and a few friends, Mr. J. Frank being chairman, and Mr. R. Jennings, jun., solicitor, secretary of the committee. The clock is constructed on the solid horizontal cast-iron bed-frame, all the bearings of gun-metal, with all Lord Grimthorpe's latest improvements inserted, and the time is shown upon a large dial, which is painted and gilt, facing the Market Place, the necessary work having been executed by Messrs. Wm. Potts & Sons, of Leeds and Newcastle-on-Tyne, who are making the large clock for St. Nicholas Cathedral, Newcastle, and one for the parish church, Stanhope-in-Weardale, county Durham.

We hear that Messrs. E. H. Shorland & Brother, of Manchester, have just supplied some more of their patent Manchester stoves to the Westhulme Hospitals, Oldham, the patent Manchester stoves previously supplied having proved very satisfactory.

ELECTRICAL.

At the monthly meeting of the Rochdale Town Council the health committee recommended that the manure works should be supplied with two new Lancashire 80 lb. pressure boilers and two large destructor furnaces. Councillor Hardman said it was four years since the question was fully discussed by the council, and their plans were approved. During the past four years they had spent 900*l.*, and their now proposed outlay amounted to about 1,100*l.* Councillor Diggle advised the council to put into the sanitary works, instead of 80 lb. pressure boilers, 120 lb. pressure boilers, and with this extra power produce electricity with which to illuminate their public buildings. It was decided to recommend the committee to put into the works boilers of 120 lb. pressure, and consider the proposal of generating electricity for public buildings.

THE *Engineering Record* of New York says it has been officially reported on the Federal Street Bridge, Boston, Mass., that, "As the Federal Street Bridge, which is operated by electric power, is one of the most important bridges with

sufficient work to test it under all conditions, the highly satisfactory results that have been attained at this bridge show that electricity not only is the cheapest power on the bridges, but is also the best."

At the monthly meeting of the Hartlepool Town Council, a recommendation of the lighting committee was adopted empowering the Council to apply for a provisional order for electric lighting powers.

THE *Leeds Mercury* says:—A large number of provisional orders relating to lighting by means of gas and electricity, which have already been sanctioned by the House of Lords, have passed the Committee stage of the House of Commons. Amongst the schemes were that under which the Earby and Thornton Gas Company are empowered to raise further capital for the purposes of gas supply; a similar order relating to the North Bierley Gas Company; and the orders authorising the Yeadon Local Board and the Wakefield Corporation to supply electricity for lighting purposes within their respective districts.

At the meeting of the Ayr Town Council tenders for the introduction of the electric light, numbering in all forty-nine, were submitted. The work was offered for in sections. The lowest offer amounted to 10,138*l.*, and the highest to 16,991*l.* The lowest offer by one firm, the Siemens Company, was 12,760*l.* Mr. Hammond, electrical engineer, stated that the estimates were very satisfactory and came pretty near the estimated probable cost.

BUILDING AND BUILDERS.

ON Saturday, the 7th inst., the Duke and Duchess of Devonshire formally opened the new Royal Infirmary at Derby, the foundation-stone of which was laid by the Queen three years ago. It is estimated that over 100,000*l.* will be required to complete the plans and furnishings. The blocks still to be erected consist of a children's ward and an ophthalmic ward. It is claimed that the hospital, which was designed by Messrs. Young & Hall, is one of the most perfect in the kingdom.

THE foundation-stone of a new free public library and technical school, which the Widnes Corporation are erecting at an estimated cost of 10,000*l.*, has just been laid. The building, it is hoped, will be opened early in 1896.

THE hybrid committee of the House of Commons appointed to inquire into the London Streets and Buildings Bill have passed a clause fixing the maximum height of any building at 80 feet, unless the building is either a church or a chapel.

THE JUDGMENT OF MIDAS.

BATTERSEA POLYTECHNIC.—GENERAL VIEW.

BATTERSEA POLYTECHNIC.—THE HALL.

THE LATE JOSEPH HILL PADDOCK, C.E.

IN the Transactions of the American Society of Civil Engineers is the following tribute to one of the victims of the recent strikes in America :—

Joseph Hill Paddock was born at East Liberty (now a part of Pittsburgh), Pa., July 30, 1856. His father, Rev. William Perry Paddock, was at that time rector of Calvary Episcopal Church at Pittsburgh (which he founded). From East Liberty the family, in 1872, moved to Philadelphia, where Joseph Paddock attended the public schools. When sixteen years of age he began an apprenticeship as machinist with Mr. J. P. Morris in the Southwark Foundry of Philadelphia, where he remained until the failure of the firm in 1875. These first years of active practical work served, no doubt, to develop and strengthen a natural aptitude for constructive work and a sound judgment regarding practical affairs, which were in later years such marked traits of his character.

Feeling by this time a desire for a more thorough preparation in his chosen field, he entered Lehigh University, and in 1879 graduated with honours, receiving the degree of Mechanical Engineer.

From August to December of this year he was employed by the Cambria Iron Company, when he accepted a position on the Lehigh Valley Railroad at Bethlehem, Pa.

From February to July 1881 Mr. Paddock was employed as draughtsman for the Vulcan Ironworks at Wilkes-Barre, Pa., when he accepted a position as division engineer on the Pittsburgh, McKeesport and Youghiogeny Railroad, under J. Wainwright, M.Am.Soc.C.E., chief engineer. Here his abilities were appreciated, and he was appointed resident engineer in charge of the first eight miles north of Connellsville, which included the Dickerson Run Branch, 3 miles long, all of which work was completed satisfactorily. During this time he also acted as assistant engineer in charge of the construction of an iron highway bridge across the Youghiogeny river, which was quite a difficult piece of work.

In January 1885 he opened an office, in partnership with Mr. A. H. Bowman, in Connellsville as civil and mining engineers, and April 1, 1886, was engaged by the Mount Pleasant Water Company, in the interests of the H. C. Frick Coke Company, to build a reservoir. This work being successfully prosecuted, he was appointed on November 1, 1886, chief engineer for the H. C. Frick Coke Company, which position he held until his death. During this period the coke industry developed at a rapid rate until there were under his supervision twenty-seven coke plants, with their accompanying mines, villages, water supplies and properties, representing in all some 30,000,000 dols.

In addition to this the company undertook in 1889 a topographical survey of the entire Connellsville coke region, which covered nearly 170 square miles, and was completed in 1892.

Altogether the work under Mr. Paddock's direction was of a varied and often of a difficult character, but by his excellent judgment of men and methods of work, by a conscientious thoroughness in carrying out the projects entrusted to him, and by the enterprise shown in the introduction of improved methods and appliances, the works of the company were placed and maintained on a high standard of excellence.

In good health, at the prime of life, and with no personal enemies, his end was as unlooked for as it was cruel.

On the afternoon of April 4, 1894, while waiting for a train at Davidson Station, near Connellsville, with Mr. Hugh Coll, the master mechanic of the company, a mob of Slav and Hungarian strikers came up, with whom he quietly remonstrated against their intruding on the company's grounds. Trouble being feared he had previously been offered a revolver, but had declined, saying that he had no use for it. But now, the men appearing in an ugly mood and menacing them, he and Mr. Coll retreated, but were immediately set upon by the mob. Mr. Coll made his escape, but Mr. Paddock was felled, probably by a stone, and then cruelly beaten and stoned until life was extinct. A bullet wound was found in the back of the head, and although the evidence of witnesses is wanting, it is probable that his sufferings were of brief duration.

Mr. Paddock was married in January 1883 to Miss Carrie Angel, of Cooperstown, who, with three girls and a boy, survive him. He also leaves six brothers and two sisters. Of the former, three are engineers.

Having spent the best part of his active life in a somewhat isolated region, and having rarely taken time for recuperation

away from home, Mr. Paddock was not so widely known in his profession as he would otherwise have been.

In manner he was genial and cheerful, in his dealings considerate, but, when necessary, decided and firm. To his friends and to those in his employ he was kind and appreciative. By his employers and by the community in which he lived he was highly esteemed. He was a member, and for several years a vestryman, of Trinity Episcopal Church of New Haven, Pa., and in general was a man of upright aims and broad views.

At the time of his death Mr. Paddock was a member of the Engineers' Society of Western Pennsylvania. He was elected a member of the American Society of Civil Engineers, October 5, 1892.

THE BIRKBECK.

THE forty-third annual meeting of the Birkbeck Building Society was held at the offices, 29 and 30 Southampton Buildings, Chancery Lane. The report adopted states that the receipts during the year which ended March 31 last reached 10,014,003*l.*, making a total from the commencement of the Society of more than one hundred and seventy-three millions (173,311,217*l.*). The deposits received were 9,102,698*l.* and the subscriptions 218,366*l.* The gross profits amounted to 220,833*l.* The surplus funds have been augmented by 176,148*l.* and now stand at 5,903,479*l.*, of which 1,732,248*l.* is invested in consols and other securities guaranteed by the British Government, and the cash in the hands of the bankers is 449,814*l.* A further sum of 25,000*l.* has been added to the Permanent Guarantee Fund, thus bringing up the amount to 175,000*l.* and the balance 155,439*l.*, making together 330,439*l.* in excess of the liabilities, the whole amount being invested in consols. The subscriptions and deposits withdrawable on demand amount to 6,053,681*l.* The fourteenth triennial bonus on investing shares has been allotted, and the amount placed to the credit of all shares in existence at the close of the forty-third year is 52,237*l.* The surplus funds (which are invested in convertible securities) are sufficient to pay the depositors 111½ per cent. on the amount of their deposits. The new accounts opened during the year were 11,096, and there are altogether 69,206 shareholders and depositors on the books, and the number of shares in existence is 54,392. Since its establishment the Society has returned to the shareholders and depositors more than one hundred and forty millions (144,460,220*l.*),

the whole amount having been repaid upon demand. The amount advanced to borrowers has been 2,536,343*l.*, and the amount of interest and bonus paid to investors and depositors is nearly two and a half millions sterling, the exact figures being 2,458,987*l.*

CONCRETE CONSTRUCTION.

A PAPER was read a few weeks ago before the American Society of Civil Engineers by Mr. F. von Emperger on "The Development and Recent Improvement of Concrete-Iron Highway Bridges," which has appeared in the last part of the Transactions. It described the Monier, Wünsch and Melan systems, in which concrete is employed with the addition of iron netting or stiff rods or bent I-beams, the last having the preference of the writer of the paper. According to him, it is now quite common in Europe to specify vaults with Monier arches and netting for buildings, and they are as common as hollow brick floors are in America. Nearly a million square feet of the Melan type of floor—that is, with arched I-beams—were constructed during the last year. The paper gave rise to several communications concerning the use of concrete in America, some of which we reprint:—

Corydon T. Purdy wrote:—I should like to call the attention of the Society to the fact that the use of steel in conjunction with concrete has already reached a considerable development in the construction of foundations for large buildings, in Chicago chiefly, and in other cities to some extent.

Mr. von Emperger's point, that these two materials are especially fit to be used together, will be appreciated by all of us who have believed this to be true and have shown our faith in that belief by our works. Ever since steel foundations, as they are generally termed, were first advocated, their enduring properties have been questioned, and even to-day some architects in that city will not use the combination. Every item of reliable evidence to show that iron or steel will not deteriorate in concrete, or *vice versa*, is therefore important in its relation to that construction.

A few words in regard to that work may not be out of place. I do not know who first conceived the idea, but it was first used by Mr. Burnham, and he well deserves the credit for its introduction. At first the metal was used only to supplement rubble masonry and concrete; then more dependence was put on the steel, and soon the masonry was omitted entirely, and only enough concrete was used to give the metal a good bed and thoroughly cover and protect it. At first railroad rails were

JAMES HILL & CO., 100^A Queen Victoria Street, London, E.C.

used, some of them old ones; then some beams were used, and as soon as the iron pool was broken, beams were used almost entirely.

In rare instances rivetted work has been used, and a few foundations have been made of light beams. Some thousands of tons of steel have thus been imbedded in concrete in these foundations.

Of course this is not the only solution of the foundation problem even in Chicago, and possibly not the best one, but the demand has been very pressing for something that would provide a large bearing without breaking the clay strata, and yet be so thin in its vertical dimension that the basement room would not be destroyed. The steel foundation was a cheap and natural solution of the problem. It quite completely fulfilled the requirements of that time; and if it will endure indefinitely there are many good reasons why it may well be used for limited loads in all times.

Mr. von Emperger is very definite. He says:—"Concrete is the best conservator of iron." The truth of this statement for foundations or highway bridges, or any other permanent construction for that matter, is fundamental and vitally important. If the perpetuity of iron or steel imbedded in concrete depends on conditions, it also becomes correspondingly important to have these conditions definitely fixed.

Jos. M. Wilson:—"We have been using cement and iron or steel in combination for fireproof floors since 1889 with great success. While not making any special claim for originality in the method employed, yet the exact arrangement adopted by us was a little different from anything that I had at that time seen elsewhere.

The great desideratum in such cases is a system that shall be easy of construction without the employment of skilled mechanics and with a minimum of expense in the manufacture.

The form of construction adopted consists of the ordinary I-beam girders, running from wall to wall, or from walls to columns, placed at distances apart of, say, from 10 to 18 feet, as may be required, between which are hung flat-iron or steel straps at intervals of 12 to 24 inches, the ends of each strap being bent and hooked over the top flanges of the girders, and the straps curved down, so that midway in their length they hang very close to the under surface of the intended floor. A level centreing having been provided, a floor is built in of concrete, completely imbedding the straps and the girders; or, if the latter are too deep for this, it is curved down on to the lower flanges of the girders. The plaster for ceiling finish is

applied directly to the under surface and under the lower flanges of girders.

We have used these floors in the American Philosophical Society building, the Academy of Natural Sciences, and the Drexel Institute, Philadelphia; in the Alumni building of the Rensselaer Polytechnic Institute at Troy, and are now placing them in a large training school in Indianapolis.

Those in Philadelphia were constructed of Portland cement. First, a coating on the centreing of 1 inch, formed of cement and sand, 1 to 2; then concrete, composed of 4 parts stone, to pass through a 2-inch ring, 2 parts sharp river sand, 1 part Portland cement; then a finishing coat on top of 1½ inch, 1 part cement to 2 parts sand, divided up into squares and tinted as may be required for the floor. If a wooden floor is desired, only 1 inch of finish is used, and nailing-strips, to which to nail the flooring-boards, are bedded in light filling on top.

In the American Philosophical Society building the spans for the first and second floors run from 8 to 16 feet; for the former the straps being ¾ by ⅝ inch, 24 inches to centres with concrete 4 inches thick, including finish; and for the latter the straps are 2½ by ⅝ inches, 24 inches to centres with the concrete 7 inches thick. These floors were intended for 80 lbs. live load.

The third floor, of 16-foot spans, carrying 210 lbs. loading to the square foot, being a library floor, has straps 2 by ⅝ inches, 12 inches apart and concrete 8 inches thick.

The Academy of Natural Sciences has five floors and roof 17 to 18 feet spans, all constructed in this way, the floors having 8 inches of concrete and straps 2½ by ⅝ inches, 18 inches apart; live-load 100 lbs. to the square foot. The work has finished up beautifully without a sign of a crack or defect anywhere.

In the Indianapolis building there are about 67,000 square feet of flooring to be laid. The concrete is to be of Louisville cement, 1 to 3 parts crushed stone with 1-inch finish on top of Dyerhoff cement and sand, 1 to 2. The spans are about 11 feet, the straps or bars 1 by ¼ inch, 12 inches apart and the concrete 7 inches thick, lightened up with open cores running through between and parallel to the straps. This floor, which is to be constructed by a Cleveland firm, has been placed, at so reasonable a figure as to compete successfully with wooden mill construction.

The Society may not be aware that a small concrete bridge was constructed last year over the Pennypack Creek, in Philadelphia, by the city authorities. The engineer, Mr. Carl A. Frick, states that it consists of two arches 25 feet 4¼ inches

RUSSELL'S PATENT COLLAPSIBLE OVEN RANGE

TOP OVEN COLLAPSED.

This New and Improved Patent Cooking Range supplies a long-felt want, by giving to an ordinary close-fire Leamington Range an oven heated on the same principle as the Yorkshire Range oven, with a direct bottom heat, making it one of the best bread or pastry ovens that can possibly be produced.

The Oven can be folded up in a few seconds, and the Hot Plate left clear for any other purpose. It will do double the work with less fuel than any other range made. It is fitted with our patent "Herald" lifting fire, with improved wrought-iron spindle-bars, so that it will toast or roast before the fire, which is almost an impossibility with any other lifting fire-range.

These Ranges are also made with double oven, as well as oven and boiler.

TOP OVEN IN ACTION.

TESTIMONIAL FROM FRAULEIN NOEDEL, Lady Superintendent to H.R.H. the Princess of Wales's Technical School, Sandringham.

"Sandringham, Norfolk: Sept. 23, 1891. SIRS,—After using the 'HERALD' Range in H.R.H. the Princess of Wales's School of Cookery for more than a year, I pleasure in testifying to its thorough efficiency in every way. It uses comparatively little fuel, keeps pots boiling on every part of the hot plate, the ovens bake well, and it supplies us with plenty of hot water. Believe me, SIRS, Yours truly, CHARLOTTE NOEDEL, Lady Superintendent to H.R.H. the Princess of Wales's Technical School."

Drawings and Particulars will be supplied direct from the Patentees and Manufacturers, BUT ALL ORDERS MUST BE SENT THROUGH AN IRONMONGER.

ROBERT RUSSELL & SONS, PEEL FOUNDRY, DERBY

Patentees of the "Herald" Range, original Manufacturers of the celebrated "Excelsior" Range, Makers of all descriptions of Cooking Stoves for all purposes, Also Tile Stoves, Air Stoves, and GENERAL IRONFOUNDERS.

span each, with rise of 6 feet 6 inches, and is built on a light skew; width out to out of parapets, 34 feet. The depth at crown is 2 feet 3 inches; the abutments, 7 feet in thickness, and the pier, 6 feet. The spandrel walls, 3 feet at the springing line and 2 feet at the coping. The entire work (foundations and all) has been constructed of concrete, German Portland cement, some portions being mixed of 1 part cement, 2 parts sand, 6 parts broken stone, and other portions of 1 part cement, 1 part sand, and 4 parts broken stone. Wire netting, $\frac{1}{4}$ -inch wire, 12-inch mesh, was placed in each layer of the concrete.

It is stated by the engineer that a saving was effected in cost of about one-fourth over that of a stone and brick bridge. Without taking up an analytical consideration of the bridge, the depth of the arch appears to be much heavier than necessary for the span, and it is probable that with a closer approach to the vertical limits, still more saving in cost might have been effected.

Mr. George Hill wrote:—The various methods suggested for the spanning of openings by means of systems less expensive than those in use at the present time, while equally enduring and strong, have been followed with much interest by engineers. We are therefore much indebted to Mr. von Emperger for the very interesting description of the Melan system.

So far as its use for highway bridges is concerned, I refrain from expressing an opinion, since that is outside my line. We are told, however, that it is coming into extensive use for floors in Germany, and it is intimated that it would have an extensive use in that direction in this country, and it is concerning this that I wish to speak.

It is true that the actual area of floors laid in it so far is relatively small as compared with the use made of the better known styles of fireproof floor construction in this country, but it is very much in excess of any record which we have to show for the first year after the introduction of any of our materials, and it therefore behoves us to examine the system with a great deal of care before expressing an opinion. Analysing the arch, we find the compression is in part taken up by the concrete, and in part by the curved metal ribs; that the thrust is absorbed by the abutments, as shown by the drawings, or presumably by tie-rods in building construction, and that we further cause the concrete to act as a beam between the curved ribs, and compel it to do all of the work of which it is capable in that position. We must use the concrete in this latter way, and it is not good engineering to add to this duty an additional

one by making it act as an arch, thus putting the fibres under a maximum strain in two directions. Mr. von Emperger cites tests also which show a bending moment at the haunches which is apparently far beyond the strength of the concrete to resist, acting as an arch, but which is readily carried by it to the curved ribs and by them resisted. Taking this view, we should simply calculate the concrete as a beam between the curved ribs, establishing proper ratios at once for span and depths, and calculate the ribs for the strains which are imposed by the live and dead loads acting as arches. Under this supposition, we would have the same amount of metal required as in a beam, minus the web.

In considering the use of such a flooring we have:—

First.—The use of curved ribs which require careful mill-work, and, in order to secure the results which are aimed at by the author of the paper, a close union between the concrete and the iron, all the metal must be free from rust until it is used in the building.

Second.—The cement must be of uniformly high grade.

Third.—The workmanship must be honest, and such as to insure a proper use of the materials.

Fourth.—In at least 50 per cent. of the cases a suspended ceiling must be provided, so as to make the bottom surfaces absolutely flat.

In addition to these difficulties, there are those existing in the actual construction, which those who have devoted their entire attention to the engineering of building know to be almost insurmountable. These are:—First, with regard to the proper use of cement; second, the time which must elapse before loads can be applied; third, the lack of fireproof qualities. In engineering structures we have an inspector, thoroughly competent, constantly upon the work to see that every portion of the mortar is used under the most favourable conditions. In buildings this cannot be done, and reliance therefore must be had, to a greater or less extent, on the knowledge of the men, who, with the most honest intentions, constantly use retempered mortar, mortar that has been far too highly dosed with sand, or contains at least 50 per cent. too much water. As a consequence of these conditions, we have established the general rule that no cement should be used in tension, and that the tensile strength of the cement should not be relied on, which, if followed, would at once bar out this system.

This is said with the full knowledge of the work done by Mr. Wilson and others, and with the further knowledge that the

With Lifting Fire.

WORKS, ROTHERHAM. Estab. 1854.

concrete arches in use here generally only rely on the compressive strength of the concrete and are so lightly loaded under usual conditions that well-dried mud would do equally well, if given a good wearing surface, until the crucial test came. Were we able to get thoroughly first-class concrete for floor arches we could adopt the principle described by Mr. Wilson in a more economical form by using steel wire of double the strength of the plates he uses, and save probably 50 per cent. of the weight of the floor framing. Companies have been formed to exploit such a construction, but they have not had marked success.

We must also remember that the general use is the one to be considered, and that the building departments of the various cities in this country have had so sad an experience when trusting to the honesty of the builders that they condemn any system which is not of the simplest character and which depends on so many elements for its success.

In a country where eight months is sufficient to practically complete a building costing nearly 1,000,000 dols., the statement that nearly three months must elapse before the arches can be fully loaded would of itself bar them out, since often the heaviest load an arch is called on to sustain is that due to the storage of materials, and is applied before the arch is five days old and after the centreing is removed.

We know that cement has been subjected to intense heat in the process of manufacture, but we also know that when heated again parts are apt to fly off, and especially where the cement is thin, as under the flanges of the beams, where it is most needed and where it would certainly fly off if touched with a stream of water while hot, thus leaving the beam unprotected against subsequent attack.

Concerning the relative strength of the two forms when used for floor construction, there is no question in my mind but that the flat arch floor is the stronger under all similar conditions of treatment, since it uses mortar in compression only; can be laid up without mortar, if desired; utilises each material in the best possible way, and in such a way that long-continued vibration cannot in any way injure it. The question of relative strength is one that we are likely to disagree upon for some time still, but, briefly summarising the tests, we know that the fireclay alone will carry about 2,000 lbs. per square foot, in compression; that the only tests to destruction of flat arches showed that the skewbacks were very weak, shearing off under about 1,000 lbs. per linear foot; that properly designed skewbacks have carried as high as 5,000 lbs. per linear foot without

failure. That in the ordinary flat arch there is an area transmitting compression of about 30 square inches and a joint area of about 144 square inches in the comparative case given, and therefore we should have a safe uniform load on this 12-inch arch of (safety factor, 10):—

$$L = \frac{W}{5.58} = \frac{8 \times 30 \times 8 \times 200}{67 \times 5.58} = \frac{384,000}{373.86} = 1,027.$$

This is on the assumption that the whole area of the arch acts; if only three-quarters acts, then the load becomes 777 lbs. per square foot. This uses only well-known formulas, and a conservative value of the crushing strength. With the Melan system, we must assume the extreme fibre strain at 90 lbs. per square inch, in order to obtain a reasonable thickness of slab between arch members, and this is confessedly very high.

Mr. Joseph M. Wilson wrote:—I think I stated clearly that I made no special claim to great originality in my form of construction. I am aware that construction of a general character similar to what we have adopted has been used in San Francisco and perhaps in other places, the detailed arrangement in our case being different. Some of the floors we have built have been finished now for four or five years.

It is possible that the building laws of the city of New York may prevent the use of floors constructed as these are, but I do not think that one of the reasons mentioned, to wit, the question of the builder not doing his work properly, should be an excuse for its rejection.

So far as plastering is concerned, the ceilings were plastered directly on the cement, and there has been no staining or other trouble with them. The ceilings in the extension to the Academy of Natural Sciences in Philadelphia could not look better. They can be considered a perfect piece of work, although they have been exposed all winter without heat in the building, as no boilers have yet been provided, and the building has been up since last fall. The work could not be in better condition than these ceilings are.

I think also the question of expansion and contraction is somewhat of a bugbear. In buildings the conditions are a little different from those of outside work. The variations of temperature are never very great, as the walls protect the interior from cold in winter and heat in summer, and in winter there is always artificial heat when the buildings are occupied. I do not think the extremes are very great in any of our buildings.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

THE WELL-KNOWN FRIEZE, ENTITLED "THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Standard*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

AN AMERICAN BUILDER'S NOTIONS OF EUROPE.*

EUROPEAN travel has become so general within the past few years that I shall not attempt to give any descriptions except those that are particularly interesting to us from a builder's point of view.

I have always looked forward to a trip across the Atlantic with pleasant anticipation, knowing there were many things of interest to see, customs, manners, &c., being entirely different from what we are familiar with here. I will not take your time telling you of the buffeting of the waves and all that, but suffice it to say we had a fairly good voyage.

Crossing by the southern or the Mediterranean route, as it is sometimes called, the first land to meet our eyes was the Azore group of islands. We did not go near enough to see anything more than the peak of Teneriffe standing up some thousands of feet. A thousand miles on and we are at Gibraltar. It was late in the afternoon when we reached there, and we did not get as good a view as I would have liked. We had several hours to wait, so went ashore in a small boat.

Here was found a strange sight indeed. A bright moon-light added to the picturesqueness of the scene. As in all tropical countries, the people pass most of the time out of doors, and a continual crowd was passing, laughing, chatting, singing, smoking, and most gaily amusing themselves and strangers. The guitar and mandolin were tinkling all the while, and taken altogether it was a strange and beautiful sight to us, coming from prosaic New York.

Resuming our journey, we had the Spanish coast with its rugged mountains sloping to the water's edge on our left, and the African coast on the right. We could get a glimpse of some of the towns, but the distance was too great to distinguish anything but the lights.

When crossing the Gulf of Lyons we are out of sight of land entirely, and the next point is the harbour of Genoa, and the city so beautifully located and presenting so enchanting a picture from the water that it has been called "Genoa the Suburb."

The mountain side upon which the city is located makes

the first impression that you have of the city, that the streets are extremely narrow and few in number. But when ashore that is dissipated, and we find them wide and very numerous, but crooked, as the steep hill requires many to be made in zig-zag to overcome the ascent.

The first place we visited was a palace, old in years but in a fine state of preservation. The interior walls were beautifully finished in marbles and stucco; frescoes, mosaics, pilasters of the most costly character are in every room. The owners at one time must have possessed great wealth.

The carpenter had very little to do in the construction, but the mason is everywhere.

One thing that greatly interested us was to see an aqueduct here and there distributing water on a level with the second storey windows, from which the occupants received their supply; there are only a few, however, so fortunate, the most of the people have to buy it in the streets. All the principal streets have mains, and it is distributed the same as here, but the plumbing question is far behind the age; and even in the best hotels it is only a cold water faucet, all the heating being done in vessels over fires.

One of the principal sights of Genoa is the Campo Santo, or home of the dead, which I will briefly describe to you.

Madison Square, enlarged five times, will give you an idea of its size. The building surrounds this square. It is about 40 feet wide and 30 feet high. Below the floor are the vaults for the dead. Any one can purchase a place of interment in size according to his means or inclination, and this carries with it wall space, on which are placed memorial tablets and statuary.

In front of many of the sarcophagi are groups of statuary, some life-size, of living relatives in attitudes of mourning, and the likeness to those living ones is said to be very faithful.

The distance around is over a mile. In the hollow square inside are the usual crosses, wreaths, &c., and altogether it is a very strange and beautiful place, well worthy of a visit.

From Genoa to Pisa we pass by the famous Carrara quarries, that we use so much of here. While we were there a strike of the workmen was in progress and assumed such proportions that the Government had to call out the troops to suppress it. The previous day the strikers had fired upon the trains, and, as a precaution, we were advised while passing by to keep well back from the windows. We obeyed orders, and fortunately passed through without any difficulty, not a shot being fired.

* An address delivered by the Hon. John J. Tucker before the Building Trades Club of New York City, and published in *Architecture and Building*.

Pisa is an old city, but has nothing to interest a tourist except the Leaning Tower and accompanying cathedral.

The tower, as nearly as I could measure it, was about 70 feet in diameter and 194 feet high. While on the top you cannot get rid of the impression that it is about to fall; in reality it is very strong and there is no danger.

A great many conclusions have been given as to its present position, some claiming it was designedly built as it is to demonstrate some question in mechanics. I do not agree with that idea. After a careful scrutiny and examination I am satisfied it is simply a case of settlement; some want of solidity in the ground has caused it all, and it has very slowly assumed the position it now holds. Had it gone down suddenly it would surely have fallen, but a very gradual settling has brought it to its present position, and it is now fixed, as it has not increased the deflection even a fraction of an inch in very many years.

Close by is the Baptistry, which has a most remarkable echo, and standing in certain positions the slightest sound is repeated a number of times.

From here we go on to Rome, the most interesting city in the world, being, as it is, the connecting link between ancient and modern times. No other city has such a wealth of historical associations, and time could be spent by months in looking up its great storehouses of attractive subjects.

Old Rome is fast disappearing. New avenues are being cut through and beautiful structures erected, and in a few years it will be a modern city, with all the facilities and conveniences of a new one.

This modernising is fast demolishing the old and picturesque, and it was very interesting to note the interiors of some of these buildings. Barns, we would call them, as far as anything goes to make a comfortable home; but what a wealth of decoration. Frescoes and stucco in the greatest profusion. And what elaborateness of detail and beauty of colouring. Some of these frescoes were centuries old, yet the colouring was as bright as if finished but a few months.

Of course, one of the first things a stranger wants to see is St. Peter's, and I was no exception. It certainly is a most remarkable building, and in its detail possibly the most perfect in the whole world. The exterior is a disappointment, for you cannot find a point of observation from which you can get a view of the structure as a whole, and in consequence have to be content to look at it piecemeal. The interior is grandeur itself. The walls are covered with most beautiful and costly

marbles, and the ceilings with mosaic and fresco. The immensity does not at first impress you, but, like Niagara, the longer you look the greater it becomes. So perfect has the detail of construction and decoration been carried out, your eye sees harmony in every part.

As an illustration. At the spring of the dome are the pictures of the four apostles in mosaic, and, looking from the floor, they seem to be about twice life-size. Climb the stairs to the gallery which is at the level of those pictures, and we find those faces are more than 4 feet across, and the pen St. Paul holds is 6 feet long.

From the top of the dome a most beautiful view of the city is obtained, and the Sabine Hills in the distance, snow-capped, make a charming frame to the picture.

We will now go to the Colosseum, the scene of the games and combats of ancient days. This is the largest and most impressive ruin. In size we can call it about 1,000 feet by 600 feet, and the outside walls are nearly 200 feet high.

At first we are awe-stricken when we think of this structure standing some 2,000 years, but a close examination reveals no reason why it should not. The climate is mild and not destructive—a great point. Then let us look at its construction. A glance would indicate brick and stone walls, but it is only superficial. The faces are brick, with some ornamental stone at openings, &c.; the interior of the wall is plain concrete, in many places 20 feet and more in thickness. One storey is placed above the other in the same order, only each is lighter in construction than the one below until we reach the top, where the average thickness might be 3 to 4 feet. As a specimen of masonry it is nothing, and not to be compared with modern work, but as a gigantic edifice and monument of labour it is the most remarkable, outside of the Pyramids, now existing. It could hold an audience of 100,000; just think—a large city.

We will now visit the Baths of Caracalla, I think more remarkable for many reasons than the Colosseum. While only a small portion of this structure is now standing, enough remains to show what a wonderful creation it must have been. History says this building was erected by the Emperor Caracalla in four years. The baths, as existing at that time, were visited only by the nobility. This was the club, the political headquarters, and the resort of all the pleasure-seekers. The entire space covered was about 1,600 feet square. The interior was divided into three parts—hot, cold and tepid, each one with a beautiful court and numerous retiring-rooms. Sixteen hundred could

bathe here at one time. The walls are similar to those of the Colosseum in construction, and underneath the main floor were the furnaces to heat the air and water. This heat was carried through flues in the walls made of clay pipe, such as we are using for flues now, of various sizes, and it is no exaggeration to say that there must have been millions of feet of them. Although the body of the walls is concrete, it requires millions of brick for the facing. And now the most remarkable part. The entire face of those walls, inside and out, was covered with most beautiful marble, carved and decorated in a most elaborate manner, and all the floor was marble mosaic in handsome design. There are many hundred feet of the mosaic tiling still to be seen, and they have excavated pieces of the marble cornice and wall decorations, such as panels, pilasters, columns, &c., which have been placed in their original position, to show how the building looked when in perfect condition. It is no exaggeration to say that the combined work of all the marble workers in this country with all their machinery could not get this marble out in the time the structure was completed (four years). How this multitude was handled it is impossible to realise, and the statement has been made (on what authority I cannot say) that 150,000 men were employed on this work, directly and indirectly. At any rate, even in this era of rapid building, I do not think any person would be mad enough to say he could duplicate it in the time.

All of this work is masonry; while they did not use iron to any extent, we do find in many of these ruins bronze very largely employed for anchors and for tying in large stone, and the secret of those walls standing so well is on account of the solidity and compactness. When the walls are broken through they are perfectly solid, no spaces—all is merged into a mass that, through crystallisation, is now as hard as stone itself. In its composition it is what we would call good mortar, no Roman cement that we have always heard so much about.

The Pantheon is another old edifice, dating back to the time of Christ and is in most excellent preservation. Victor Emanuel's tomb is here, and services are held there daily. The peculiarity of the building is that there are no windows—all the light comes in through a circular opening in the top of the dome. It is entirely open, and as it was raining when I visited it, the floor underneath was as wet as the sidewalk outside.

In front are a number of granite columns, 16 feet in diameter and 50 feet high, monoliths. They were brought from Egypt, and how they ever handled them is a problem to me.

There are several forums still in an excellent state of preservation. Here was in ancient days the centre of commercial life. Here the bankers had their stands, the lawyers their headquarters, and the proclamations of emperors were read. In fact, the forum was the centre of all but the social life. I think we do better to-day in distributing these important functions.

From Rome to Naples we pass by some of the aqueducts that supply Rome with water. The country adjacent to Rome is level and a little swampy, so these aqueducts are built on a series of arches about 40 to 50 feet high and have a conduit of about 5 feet square. One built by Nero is still in use and in good condition apparently.

The old road from Rome to Naples is still in use and you will recall it from Biblical associations—the Appian Way. The nobility erected mausoleums along the roadside and the ruins are seen for miles. The roadway is paved with large flat stone worn into ruts 6 and 8 inches deep. It is time for reflection, as we ride along and think of this old highway, the millions that have passed over it and the scenes enacted upon those old, worn, silent stones. Armies have gone out with banners flying to return crushed and beaten; slaves have come into Rome by this road, never again to see loved ones or native land, and so on. What a volume could be written. And if those stones could talk, what a story.

From Rome to Naples the country is very fertile and we had a good chance to see the peasantry till the soil. There are no ploughs, as we understand them, but spades, all spades, a row of sixty or more all turning over the soil by hand. At first you think it very slow, but, not having to dig deep, it is astonishing how much ground they can cover in a day. The country through here is largely given up to vineyards, and this will show how they economise. They plant trees, what we would call scrub poplars, cut off the tops when up the required height, and train the vines over them. When the sprouts come out and reach a length of 3 or 4 feet they are cut off and brush brooms made of them, which are sold in the streets of the city.

The railroads in Italy are controlled by the Government and kept in most excellent condition. The road-bed is well ballasted and the cars clean. The speed is not equal to that of our trains, but the people are not in a hurry, so what difference does it make whether it takes three hours or four hours if you get safely to your destination? The first-class carriages have all the conveniences, but not the second or third class. The

stations are carefully looked after and it would do no harm if some of our companies would pattern after them.

Old Vesuvius is the first thing to strike your eye on reaching Naples, and it is a grand sight to see that old chimney-pot belching out the smoke.

The most important point to a tourist at Naples is the ruins of Pompeii. This city and also Herculaneum were destroyed by the eruption of Vesuvius. Herculaneum was buried in lava, and, of course, totally destroyed, so it was useless spending time and money trying to discover the remains. Pompeii, however, was buried in ashes, and while it has been an expensive matter to remove the immense amount of ashes covering the city it has been successfully done. The Government has prosecuted this work in a most careful manner; in fact, after a certain portion was removed by shovels, for fear of destroying or injuring the work the rest was all removed by hand. Everything is allowed to remain standing, as far as possible, and we saw many walls and columns twenty and more feet in height. Strange as it may seem, we saw in some rooms beds built of masonry. In fact, it is all masonry; wood does not seem to have entered into this construction. Almost all the walls are frescoed, and the colours are still as bright and the design as plain as when this calamity occurred. In the museum we saw bodies which had been exhumed and thousands of relics of all kinds, which awaken a curious interest when you think these people perished nearly two thousand years ago and that you are looking at their household utensils, jewellery, &c.

Naples is a very beautiful city, as regards the view from a distance. It is the largest in Italy, having a population of 600,000. The streets for the most part are fairly wide and are kept well, except along the water front, which is dirty in all cities. There are several large museums well filled with historical and other objects, and the paintings are numerous and valuable.

Naples has the reputation of having more poverty than any other city in the world, and possibly it is so, but you do not see it. The Italians have been compelled to practise the most rigid economy for years, and they know how to make the most of everything. If you patronise the first-class hotels you will find the prices equal to those here, but of course there are many grades of hotels. After the hotels come the vendors of food, whom you will see in large numbers in the streets. They carry a little charcoal furnace, and will cook you a chop, sausage, fish, or whatever they may have, while you wait, and for three or four cents a very passable meal can be had. I

don't suppose we would care for it, but it answers for the class it is intended for. I noticed one remarkable thing, and that was there were no barefooted people to be seen; bare heads in plenty, but all had shoes of some kind.

The curse and burden of the Italians is the everlasting tax. Nothing is spared—the food they eat, the clothes they wear, the water they drink, everything except the air is subject to a tax. Those in the cities have more severe burdens than the peasantry, but it is always tax, as the army and navy must be supported.

From Naples we go to Florence, a most interesting and beautiful city. The streets here are narrow, and the absence of building laws allows an owner to do as he pleases, so you see bay windows and all kinds of encroachments wherever you go, but the streets themselves are well kept, which, in fact, is true of the streets throughout Italy.

The renowned galleries the Pitti and Uffizi are in this city, and, as collections of paintings and sculptures, are not excelled in all Europe. The cathedral is one of the finest in Italy, and has examples of mosaic and stone carving considered by experts to be the most perfect in existence. The baptistry of this cathedral has a pair of bronze doors, considered the finest in the world for beauty of design and execution. They are divided into a number of panels, each one a Biblical subject—the figure in miniature, but perfect. Some years ago it was decided to have a pair of duplicates for the Capitol at Washington, but the subjects were not considered appropriate for a civil building, and the design was abandoned, and the panels are made to contain subjects from American history.

Speaking of the condition of the streets, I might say here that when any repairing is required it is attended to at once and then enclosed, so it is perfectly set before any vehicles are allowed to pass over it. The water and gas are controlled by the Government, so there is no tearing up of the streets for new mains, &c., every few months.

We now go on to Venice, "The Bride of the Sea," as it is rightly called. Originally a cluster of small islands, they commenced by driving piles and filling around with concrete to form a foundation, and on this they erected their houses. The city has now some sixty or seventy islands connected by three hundred and more bridges. Everything is transported by gondolas. Not a horse or a wheeled vehicle in the city. On the Grand Canal there are some small steamboats, and during the past six months some electrical and naphtha launches have been introduced, but the great bulk of the travel is in gondolas.

THE MOST PERFECT AND RELIABLE SYSTEM OF VENTILATION AND HEATING FOR SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

The people as a whole do not keep house. Most of the meals are taken in cafés or else purchased cooked at the stores and heated on a charcoal stove. While this mode of living is prevalent throughout Italy, Venice, I was told, has more cafés and delicatessen stores than any other city. The palace of the Doges and St. Mark's are the principal buildings of interest and they both deserve a careful examination, not only on account of their beauty, but for the excellence of the construction which has enabled them to stand for centuries with so little signs of decay. In the palace I saw some filigree work which I had admired in a New York house and was told it was more than three hundred years old, so I am satisfied that while our modern construction may be an improvement the decoration has not very much improved in some departments. The cathedral contains some of the most beautiful mosaics in glass that can be found and the marble mosaic floor is a study. There are in it some six thousand squares and no two alike.

Our next point is Milan, and to many this is the handsomest city in Italy. The streets here are wider than any we have found and the buildings are bright and cheerful and have a more modern appearance. The cathedral is an architectural study and a most remarkable building it is, second I believe in size in the world. While St. Peter's is noted principally for its interior, this one's reputation is for its exterior. The material is white marble and the walls have some six thousand statues of saints, no two alike. The finials on the flying buttresses all end in a flower, of which there are eighteen thousand, no two alike—so I was told; I did not verify the statement. It is a wonder and well repays a careful study.

From there we go on to Paris, by way of Switzerland. The scenery is most beautiful and deserves all the praise that so many travellers have accorded it. Paris the gay, the capital of France, is all that has been claimed for it—the brightest and liveliest city in the world. The streets are broad and paved with wood and asphalt, and as clean as possible. I have never seen such clean streets. The system of cleaning them is perfect. Every little way there are iron receptacles for the dirt and rubbish, and men are continually dodging in and out among the vehicles, cleaning continually. The gutters are flushed every night by means of pipe connection with the mains, and we could well profit by adopting the same means here.

One of the beauties of Paris is the lining of trees along the boulevards and principal avenues, so that when you take a birdseye view from some high point the green foliage is a relief from the brick and mortar. In a general way Paris is a tedious

city to look at, architecturally speaking. The authorities decide upon the elevation for an avenue, and no owner is permitted to alter it. With the interior you can do as you please, but the exterior is fixed. This makes the appearance of the buildings monotonous, and you do not have the variety you find in our American cities. There are advantages in each method, and nearly all the European cities that are making any extended improvements are following the Parisian idea. At any rate, whichever may be the best, you need never fear that an adjoining owner may put up a structure 500 feet high and depreciate his neighbour's property.

Building operations there are conducted much more slowly than here. You cannot make use of the streets for materials; they must all go inside, and consequently can be brought only as fast as wanted. There is no comparison in the methods of mason, carpenter and ironwork; in fact, regarding the use of iron, they are far behind us, and iron does not begin to play the important part it does with us.

In Brussels I did not find any activity in the building line. The general appearance of the city is similar to that of Paris, except in the old portions, where are still found some beautiful specimens of Flemish architecture.

Antwerp is a mixture of Dutch and Flemish, but the style is quaint and very interesting.

The Hague, a few hours on, is a most beautiful place. The buildings have a neat and clean appearance, and all shows the thrift and careful attention to little things which is so characteristic of the Dutch.

Amsterdam, the Venice of Holland, is a charming city. The whole appearance of the buildings and people impresses you at once that you are among a people of wealth and importance. The colonies of Holland have brought great wealth to the country, and here we find the headquarters of the commerce of the East Indies. I found a great deal of building going on, and it was of a fine and durable character. In fact, the bricklaying and stonework was more like our own than any I had seen.

From here we go to London, the greatest city of the world. You cannot imagine what it is. We have a pretty good idea in New York of what a large city is, but the concentration of people is so great here we can form no idea of the moving mass without actually seeing it.

There is very little building being done here and I had very small opportunities to compare the methods and work, but from what I did see I do not think we can get any points. In

a general way I should say they are building as we did twenty-five years ago, heavy walls and fireproof construction only in a few cases, but so massive are their structures that fires rarely occur. It is unfortunate that the climate is so severe on the buildings, the fog and smoke destroying the appearance of the finest buildings in a few years.

As an interesting city to a tourist too much cannot be said, and on every hand we found something to claim attention; but we are travelling as builders and must prepare to again cross the broad Atlantic, bidding farewell to foreign lands and all anticipation for a view of our own country.

Briefly summarising, I can truthfully say that as mechanics we are in the first rank, and considering the character of our structures and the conveniences they afford the occupants, we are superior to the entire world. And in all branches of the building trades you can find examples here that cannot be duplicated in any part of the world outside of our own country. And I believe, were some of our most famous commercial buildings to be erected in any European city, to carry out every detail it would be necessary to have some American mechanics to do the work.

EXTENSION OF THE CHESTER ASYLUM.

A SPECIAL meeting of the Cheshire County Council was held at Chester Castle on June 28, when the following resolutions were adopted:—1. That in the opinion of this Council it is expedient that the county should continue to provide asylum accommodation for the pauper lunatics of the county boroughs of Birkenhead and Stockport (Cheshire portion), provided such boroughs enter into an agreement to be prepared by the clerk of this Council, embodying the following provisions and such others as he may consider necessary, for the protection of the interests of the county, viz. (a) that the contributions of the county boroughs named towards the cost of maintaining, repairing and enlarging the existing asylums, or either of them, and the repayment of existing or any future loans and pensions, and any other expenditure that they are at present liable to contribute to, be based upon the daily average number of inmates in the two asylums from each of the boroughs named in proportion as those numbers respectively bear to the total daily average number of inmates in the asylums, for which the county is legally liable to provide accommodation; (b) that the county boroughs named, or either of them, shall not terminate the agreement without the consent

of the County Council, whilst any monies borrowed by the County Council for the purpose of providing asylum accommodation are due and owing; (c) that the representation of the county boroughs named upon the committees of visitors of each asylum, and which for the purpose of such representation shall be taken as one, be in proportion to their contribution, and such representation shall be divided by the county boroughs upon the committees of visitors of each asylum as they may, with the approval of the Council, mutually arrange. 2. That the asylums extension committee be, and they are hereby reappointed, and authorised to complete the negotiations with the county boroughs of Birkenhead and Stockport, and that the common seal of the Council be affixed to any agreement or agreements with such boroughs that may be recommended by the committee. 3. That, having regard to the fact that the county boroughs of Birkenhead and Stockport, and also the Council, have already concurred in the proposal to enlarge the asylum at Upton, the increased accommodation which is at present urgently required for the pauper lunatics of the county be provided by enlarging that asylum, so as to accommodate 416 additional patients. 4. That the plans prepared by Messrs. Grayson & Ould for enlarging the asylum at Upton to accommodate 416 additional patients, and which plans have been approved by the Commissioners in Lunacy and the Secretary of State, together with the following estimates submitted by the architect for carrying out such plans, be adopted:—New buildings, 62,400*l.*; warming and ventilating, 3,600*l.*; outfall drainage, 1,000*l.*; electric light for new building, 2,000*l.*; architect's commission and clerk of works, 3,200*l.*; furnishing 4,000*l.*; total, 76,200*l.* 5. That the plans prepared by the county surveyor for the new farm buildings for the asylum at Upton, together with his estimate of 2,650*l.* for carrying out such plans, be adopted. 6. That upon the agreement with the county boroughs of Birkenhead and Stockport being completed, an estimate of 80,000*l.* be formally submitted to the finance committee as the probable amount that will be required to carry out the work shown upon the plans prepared by Messrs. Grayson & Ould and the county surveyor. 7. That upon the agreement with the county boroughs of Birkenhead and Stockport being completed, the clerk be authorised to make application to the Local Government Board for permission to borrow 80,000*l.* on the security of the county fund and of any revenues thereof, and that, inasmuch as the providing of additional asylum accommodation is one of

OVER ONE HUNDRED PER CENT. PER ANNUM

An investment bringing in such a return in these dull days is worthy of attention. In a letter to the **YOST TYPEWRITER COMPANY**, of date April 4 last, Messrs. PRICE BROS., of Dudley, wrote:—

"As to the objection of first cost, all we have to say is that we saved the cost of our Machine in less than twelve months."

TRADE MARK

REGISTERED

The Machine referred to as such an excellent investment was a **YOST** Typewriter. The **YOST** will yield you the same return that it has brought to Messrs. PRICE BROS.

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

BAXENDALE & CO.,

Miller Street, Manchester, and Hanover Street, Edinburgh.

great urgency, the chairman and vice-chairman of the Council, the chairman of the Upton Asylum Committee of Visitors, and the chairman of the Asylums Extension Committee be authorised to interview the officials of the Local Government Board, with the object of expediting the holding of any local inquiry which the Board may consider necessary to hold, and if necessary to obtain the sanction of the Board to the work being commenced prior to their sanction to borrowing the amount named being given. 8. That upon the sanction of the Local Government Board being obtained to the borrowing of the 80,000*l.* before mentioned, the finance committee be authorised to borrow such amount by county stock or otherwise, in such sums and at such times as they may consider necessary, for the purpose of meeting the instalments that may be payable upon any contracts that may be entered into for carrying out the works before mentioned. 9. That upon the sanction of the Local Government Board being obtained for the borrowing of 80,000*l.* before mentioned for enlarging the asylum at Upton, to accommodate 416 additional patients, the visitors of the Upton Asylum be, and they are hereby authorised to advertise for, and accept in the name of this Council, contracts for the enlargement of such asylum in accordance with the plans prepared by Messrs. Grayson & Ould and the country surveyor, and also to appoint a clerk of the works to superintend the erection of the same, reporting to this Council the names of the persons whose contracts they accept, and the amounts thereof, and also the person appointed as such clerk of works, and further submit to each quarterly meeting of this Council reports as to the progress of the works. (10) That the common seal of this Council be affixed to any contracts accepted by the committee of visitors of the Upton asylum for the enlargement of the asylum at a cost not exceeding 80,000*l.*, and also to any mortgage not exceeding that amount that may be arranged by the finance committee.

RANGOON IRONWOOD.

THE Agent-General for the British Colony of Tasmania is instrumental in sending hardwood blocks for paving our roadways. This is just as it should be. We have had enough of the soft wood from the Baltic district, where, by-the-by, we pay heavy duties for every item of goods we send into the district. There is yet another Anglicised colony whence we may derive

a suitable road-paving, and that is the "pinko," or ironwood, of Rangoon, which is very solid and hard, and is considered to be equal in wearing capacity to the noisy granite blocks with which many of our streets are yet paved.

The recent rains have protected the eyes from the filthy accumulation of London dirt called dust, and now that fine weather is upon us, we shall doubtless suffer from inefficient street cleansing. It would be valuable to know how many London pedestrians have contracted affections of the eyes from the so-called dust. Not only the eyes but the lungs of the London visitors are affected, yet nothing is done to prevent the nuisance, save perhaps in the little Strand district, where Surveyor Ventris hoses down the streets with water from the mains in spite of the feelings of that excellent body the London County Council. The proper cleansing of the streets as carried out in Covent Garden district, whereby the street filth is driven direct into the sewers instead of into the eyes and lungs of the public, suggests a large subject—the cleansing of the streets in the hands of the district surveyor, and the underground sewer in those of the London County Council. It remains for the latter power to drive the material to the outfall; this can be done by a proper hydraulic flushing system, which, however, is not yet in vogue in London, where the authorities might take a lesson from Liverpool, where the system has been given a trial with great success.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THIS Society has just paid a visit to the works of the Linde British Refrigeration Company at Shadwell. The members were shown over them by Mr. C. W. Vollmann, chief engineer of the company. The visitors were conducted to the engine-room, where the process was described, and were shown some excellent engines, pumps and other machinery. They were then conducted to the floor above, where were seen the methods adopted for cooling the ammonia which was used in the Linde process and new evaporative surface-condensers. Members were then taken to the ice-making rooms, where they were shown a very complete plant. The ice, which is made from filtered water, is formed in the shape of square truncated pyramids; the moulds are of wrought-iron. These moulds are arranged in rows, and are attached to frames which are raised by means of an overhead traveller when required. The moulds are filled by means of curved tubes, which are connected to a

horizontal tube capable of being turned, and is turned, so that the ends of the curved tubes are lowered to the bottom of the moulds, and as soon as these ends reach this position a valve is opened in each bent tube, and the water flows into the moulds with the smallest possible admixture of air. When the filling is done the curved pipes are withdrawn, and the moulds being immersed in a brine freezing mixture, freezing commences. The row of moulds furthest from the filling tubes, having been emptied of the ice-blocks that are in it, is brought back to the filling end. The newly-filled moulds having been pushed forward, the fresh set of moulds takes the place of the former, and so on continuously. Large quantities of the ice made is used by the fishing-boats that attend the adjacent market, the ice being specially crushed for them. The method of crushing was shown, as was also the arrangement made for specially delivering the crushed ice to the boats. The cold store was next inspected, and those present then proceeded to an adjoining room, where refreshment was provided through the hospitality of the company. A hearty vote of thanks was passed to Mr. C. W. Vollmann as the company's representative, and to Mr. C. W. Vollmann himself, for the kindness shown to all present. Mr. G. W. Willcocks, M.I.C.E., having proposed, and Mr. E. H. G. Brewster, M.I.M.E. & Co., having seconded the proposal, and the members having bid good-day to Mr. C. W. Vollmann, they proceeded to Blackwall, where they inspected, through the courtesy of Mr. A. R. Binnie, the chief engineer to the London County Council, the works of the Blackwall Tunnel now in course of construction.

COST OF LONDON IMPROVEMENTS.

A RETURN issued by the works committee of the London County Council shows the scope and cost of recent operations conducted by that body throughout the metropolis. From May, 1893, to March last the total outlay on completed works was 21,156*l.* 16*s.*, being a saving of fully 2,000*l.* on the estimates. The undertakings finished, but for which the accounts have not yet been returned, represent a probable expenditure of 43,235*l.* 13*s.* 11*d.*, while the sum of 1,120*l.* has been disbursed on smaller works. Costly as these schemes of the Council are, they are dwarfed by the still more extensive enterprises in progress or about to be commenced, the latter being estimated at 82,738*l.*, while 177,445*l.* is given as the likely charge for the

former. The public health and housing committee is responsible for the heaviest of these items—that known as the Boundary Street Improvement scheme—which is estimated to cost 44,200*l.*; while the main drainage committee is second with 30,000*l.* for the extension of the Fleet storm relief sewer.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

12263. Jeshurun Coulthurst, for "Improvements in socketted earthenware drain-pipes."

12319. James Evans, Charles Harris and Thomas Francis Evans, for "Improvements in ventilating apparatus."

12354. Rowland Hodges and Samuel Hill, for "Improvements in fastenings for fanlights and for like purposes."

12376. George Thomas Lester, for "An improvement in sash-fasteners."

12457. Benjamin William Heymanson, for "Bottom bolt spring socket for folding doors."

12614. Alfred Dyson, for "Improvements in and connected with water-closets."

12636. Alexander Marshall, for "Improvements in ventilators and chimney-cans."

12683. Arthur Lawrence Rock, for "An improved liquid seal valve for controlling the passage of gas and air to and from hearths."

12738. Walter Flitcroft, for "Improvements in or relating to sliding and swiveling windows."

12748. William Newbigging, for "Improvements in mounting electric and other lamps."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams: "Robert Adams, London."]

ROBT. ADAMS'S Patent
Ventilating Apparatus for

Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

No. 208. Special thrust motion round section Bolt, suitable for very narrow sashes. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

SALISBURY.—Three Houses. Mr. Alfred C. Bothams, Architect, 39 Castle Street, Salisbury.

SALISBURY.—July 26.—For Building Four Cottages. Messrs. John Harding & Son, Architects, 51 Canal, Salisbury.

TRADE NOTES.

THE Western Schools, North Shields, for the Tynemouth School Board, are being warmed and ventilated throughout by means of Shorland's patent Manchester stoves and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester; the patent Manchester stoves previously supplied to these schools having proved very satisfactory.

A VERY large clock has just been erected at St. Thomas's Church, Stockport, as a memorial to the late Mr. Alderman William Smith. It has four illuminated dials, and strikes the hours and chimes the Cambridge quarters. The whole of the work has been carried out by John Smith & Sons, Midland Clock Works, Derby.

AT the meeting of the Gainsborough Local Board the tender of Sir H. Bacon to make up Stanley Street for 442*l.* was accepted. It was agreed that a portion of the market-yard should be used for overflow markets, half the takings to be paid as rent. Land for a new reservoir was also to be purchased for 500*l.*

THE committee appointed by the Lancashire Asylums Board to consider the estimates submitted for the new asylum at Winwick have recommended the acceptance of the design of Messrs. Henry Crisp & Oatley. The revised estimate is 247,446*l.*, the original estimate being 300,000*l.*

WE are pleased to note that Messrs. Clark, Bunnett & Co., Limited, have just erected a new hydraulic passenger lift for Mr. A. Simner at Grosvenor Mansions, Belgravia. The whole of the work was so satisfactorily carried out that this gentleman invited all the men who had been engaged upon fixing the work and the foremen of the various departments, numbering eighteen, and about forty friends, to a most sumptuous banquet at the Holborn Restaurant.

A NEW clock, striking the hours on the large bell, and showing the time on one large external dial facing the market-place, has been erected in the ancient parish church, All Saints, Kirby Moorside, by Messrs. W. Potts & Sons, clock manufacturers, Leeds, and Newcastle-on-Tyne, from instructions received from the committee, Mr. J. Frank acting as chairman, and Mr. Richard Jennings, jun., acting as secretary. The Right Hon. the Earl of Feversham, Duncombe Park, headed the subscriptions by a handsome donation. The clock is made from the designs and plans of the Right Hon. Lord Grimthorpe. Messrs. Potts are also making the large clocks for Newcastle Cathedral and Stanhope Parish Church, Wear-dale, county of Durham, and Rufforth Church, Yorkshire, the Sheffield new city hall, and the large clock for the tower of the Leeds new post office.

AT a special meeting of the Stockport Town Council held on Wednesday, four tenders were submitted for the carrying out of contract No. 3 of the extensive scheme of sewerage now in progress. The amounts varied from 20,360*l.* to 26,421*l.* The tender for the first-named sum, from Messrs. T. & W. Meadows, Heaton Norris, was accepted.

VARIETIES.

UPPER BAVARIA, including especially the country about Ebersberg and Schrobenhausen, has suffered, the Berlin correspondent of the *Standard* says, very severely from the terrible tornado of wind and rain which visited those districts on Saturday afternoon. The village of Forstinning was almost entirely destroyed by a whirlwind, eighty, or more than half of the hundred and fifty houses being blown down. In two other villages also many of the houses were destroyed. In another place the church steeple was levelled with the ground. Whole groups of trees were mown down like grass, and the harvest throughout the district has been practically annihilated. During an apparently harmless thunderstorm, a whirlwind of terrific violence suddenly arose, demolishing houses and breaking down or tearing up trees a metre to a metre and a half in diameter. In some places the streets are covered a metre deep with stones. The burial grounds are totally devastated. Large tracts of forest are levelled to the ground. While the storm raged trees were blown from five to six hundred metres through the air. The region affected is about fifteen English miles long and nearly two broad.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons, or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

440.—English Carved Oak Writing Table, Leather Top, on Casters, £15 10s.

Without Drawer and Pigeon-holes on Top, £10 10s.

DAMAGE to the amount of 10,000*l.* has been caused by a fire which occurred in a mill at Golcar, near Huddersfield, owned by Messrs. John Haigh & Sons, manufacturers.

THE Paddington Vestry have earnestly protested against the proposal of the School Board (accommodation committee) to erect a Board-school in South Paddington, at a cost which will probably reach 30,000*l.*, and entail an annual expenditure of 1,800*l.*, while there is already school accommodation in excess of the requirements of the population.

MR. H. GILBERT WHYATT, A.M.Inst.C.E., M.San.Inst., deputy borough engineer, Salford, has received an invitation to deliver a course of twenty evening lectures on sanitary engineering at Owens College during the coming winter. The lectures form a portion of the whole course in connection with the certificate of proficiency in hygiene and sanitary knowledge issued by the Victoria University to inspectors of nuisances.

THE laying of the line of mains, with service reservoir, required to enable the Darton Local Board to use water obtained from the well belonging to the Penistone Local Board, is now completed. The distance from the well to the reservoir is between nine and ten miles, and the pressure on the mains equals 425 feet head. The works are now being used. The contractors have now been settled with. The two contracts for iron pipes and general work amounted to 3,000*l.* 17*s.* 6*d.* and 2,150*l.* 15*s.* respectively, or a total of 5,150*l.* 12*s.* 6*d.* The actual cost of the works, after adding extras and making deductions, has been 2,707*l.* 15*s.* 1*d.* and 2,226*l.* 13*s.* 6*d.*, or a total of 4,934*l.* 8*s.* 7*d.* The works have therefore been carried out for 217*l.* 3*s.* 11*d.* less than the total contract amounts, and considerably below the engineer's estimate. The engineer to the scheme is Mr. W. H. Radford, C.E., of Nottingham.

THE Tooting Lodge Estate adjoining Tooting Bec Common has been acquired by the Metropolitan Asylums Board for the erection of an infirmary for 1,320 imbeciles of the metropolis.

At Spalding information has been received that boring operations at Deeping St. Nicholas, some five miles distant, which have been in progress for the past three months, have been successful, and that a splendid supply of water, about 40,000 gallons per day, is the result. The work has been carried out by the South Lincolnshire Fen Water Company, the contractor being Mr. Sykes, of Bankside, London. The bore extends to a depth of 285 feet, water being tapped in the limestone.

THE Holywell Local Board, being about to provide a water supply for the town, caused an analysis to be made of water from Llynhelig and St. Winifred's Well. The water of Llynhelig was pronounced unfit, but that of the well was highly commended, the analyst stating that for organic purity it was the finest sample he had ever met with.

THE Hanley Town Council have received a letter from the Local Government Board sanctioning a loan of 4,000*l.* for the electric wiring and fitting of the various municipal buildings.

THE *Nairnshire Telegraph* says that Hugh Leslie Mackenzie, aged thirteen, son of Mr. David Mackenzie, architect, Nairn, has won by competitive examination a foundation scholarship at Fettes College, Edinburgh, of the annual value of 130*l.*, including education and scholarship.

THE new casual wards for St. Saviour's Union, Southwark, erected at a cost of 9,000*l.*, but 200*l.* under the estimate—of which Messrs. Henry Jarvis & Son are the architects—are now completed and ready for occupation. A deputation of members from the St. Pancras guardians, who have viewed them, have intimated that they will advise their Board to copy.

THE Marylebone Vestry have voted their Baths Commissioners 42,000*l.* to reconstruct and enlarge the present bath and washhouse buildings in Lisson Grove.

CONTINENTAL PASSENGER TRAFFIC.

THE success of the Great Eastern Railway Company in their continental department was further proved during the week, when the fourth vessel built by Earle's Shipbuilding Company for the service was successfully launched at Hull, the christening ceremony being performed by Lady Frederick Seager Hunt. The vessel, named the *Vienna*, is a steel twin-screw steamer 302 feet long, 36 feet beam and 16 feet depth of hold. She with her sister vessels, the *Amsterdam* and *Berlin* (which were placed on the Hook of Holland route in May last) are the three largest vessels running a daily service between England and the Continent. The *Vienna* is fitted with two entirely separate sets of triple compound engines, designed to develop 5,000 horse-power, giving a speed of 18 knots an hour. Her fittings will be of the most luxurious description, including the electric light and all the most recent improvements. Sleeping accommodation will be provided for over 200 first-class passengers.

METROPOLITAN ASYLUMS BOARD.

MESSRS. A. & C. HARSTON, 15 Leadenhall Street, were, without competition, on the recommendation of the committee, appointed architects for the imbecile infirmary, to accommodate 1,320 patients, which it is proposed to erect on the Tooting Lodge estate, adjoining Tooting Bec Common. It was also agreed to adopt the plans prepared by Messrs. Pennington & Son, architects, for the erection of five two-storeyed pavilions for fever and diphtheria patients, and one block for isolation cases at the North-Western Hospital. These six pavilions, which will accommodate 226 patients at a cost of 43,500*l.*, will take the place of the existing temporary wards erected nearly twenty-five years ago, and now in a very dilapidated condition. The construction of the fifth or lowest ward will be deferred pending the settlement of the plans for the proposed ambulance station adjoining the hospital.

FOLDING PARTITIONS.

WE have previously called our readers' attention to the excellent folding partitions manufactured by Messrs. Peace & Norquoy, of Port Street, Manchester. These partitions were actually designed to meet the greatly increasing demand for a reliable and simple system of dividing one room from another by means of a moveable partition. It may be mentioned that the design of moveable partitions is not so easy as it would be thought at the first blush. The ideas and requirements of Government inspectors and insurance companies have to be met to a nicety, and Messrs. Peace & Norquoy have been successful in suiting not only the requirements of these officials and companies, but they have succeeded in meeting the convenience of those who have actually to use them, and it is considered that this important invention supersedes all other methods for dividing and subdividing rooms. By it a large hall can be divided, or the partition, by an easy gliding motion, folded back against the wall in two minutes without leaving any obstruction on the floor. These partitions have been approved and specified by architects in the erection of new schools and adopted by various school boards.

Messrs. Peace & Norquoy have been fixing six of their patent improved folding partitions in Coleman Street Ward Schools, London, under the superintendence of Mr. Martin L. Saunders, architect, London; they have also been adopted in Grove House School, Chatsworth Road, Croydon, for Messrs.

Berney & Sons, architects, Croydon. It is just about twelve months since these partitions were first introduced, and at that time Messrs. Peace & Norquoy fixed them in five schools for the West Hartlepool School Board, and after a year's trial we are informed that they received an order for four more partitions from the same Board. There can be no question that architects are finding out that these partitions are without doubt the most simple and reliable method of dividing and subdividing rooms by means of a moveable partition, as they are being used all over England.

Some while ago we noticed in our columns a report by the Rev. T. W. Sharpe, C.B., chief inspector of schools in the Metropolitan Division, in which he complained of the ill-planned rooms which could not be used for teaching without considerable structural alterations. He also complained of a want of a central hall for drilling, &c. Now these are cases which the improved folding partition meets, as a large hall can be divided into classrooms, and for drill, or assembling of the scholars, can be thrown open in a few minutes, leaving the whole space clear.

THE DERBYSHIRE INFIRMARY.

THE new Derbyshire Royal Infirmary, the foundation-stone of which was laid by the Queen on May 21, 1891, was opened by the Duke of Devonshire, accompanied by the Duchess. Their Graces were presented with a golden key, by which they effected their entrance, after which they proceeded to a spacious tent erected in the grounds, where various speeches were delivered. The Duke of Devonshire congratulated his hearers on the successful progress of the work of founding a new infirmary, and said the appeal for subscriptions had been nobly responded to, something like 76,000*l.* having been raised. He announced that Mr. G. H. Strutt, sen., had offered to defray the cost of another ward, which would amount to about 12,000*l.*, on condition that it should bear the name of a deceased relative, this donation being in addition to 5,000*l.* previously subscribed.

The whole of the stonework, including the moulded Hopton Wood stone staircases and the marble work in connection with the lavatories, &c., was executed by Messrs. J. Hodson & Son, of Castle Meadow Road, Nottingham, a special plant being put down on the site to deal with it. The firm have been entrusted with the order for the whole of the stonework for the new County Council buildings at Derby.

LYCEUM THEATRE.**THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS**

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4 brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

EARL'S COURT EXHIBITION.

WE have received from the Tubular Lock Syndicate, Limited, 38 Middlesex Street, Aldgate, a sample of their 6 inches by 1 inch patent tubular reversible mortice lock. On examination it is seen that it is fixed by three operations of a centre-bit, one for the lock and two for the face plate, saving about two-thirds of the time spent in fixing the ordinary mortice lock and saves the tenons. Their exhibition lock at Earl's Court is 6 feet by 1 foot, a working model 4-lever lock; it weighs 3 cwt. The handles each weigh 1 cwt. as erected on a wrought-iron stand 8 feet high; it is very effective. This lock had the highest award at Chicago, 1893; also gold medal, Edinburgh, 1890; Paris, 1889; gold medal, prize medal, Melbourne, 1888; Society of Architects' Exhibition, London, 1887; prize medal, Builders' Exhibition, 1886. The firm make all kinds of locks and latches in the tubular form for all purposes; locks made *en suite* with master keys. Specified by some well-known architects. The last notable buildings fitted are Mr. W. Astor's new block on the Embankment. The tubular lock can be used with one handle, two handles, or as a night latch, the key doing the work of the handle. The action of turning the key throws the latch forward, locking it and disconnecting it from the handle until it is turned back by the key, the handle then draws the latch. Any architect who would like to see samples has only to apply to Mr. W. Harvey Stringer, general manager.

The tubular locks are so constructed that the wear is equally distributed over all the working parts, thus ensuring the longest life possible for the locks. The special advantages claimed over other locks are as follows:—The tubular locks are 25 per cent. cheaper than ordinary mortice locks; the cost of fixing is very much less than other locks; the doors are not weakened, as the cutting away of the tenons is not required, this weakening of the doors being unavoidable with all other mortice locks; the tubular locks being reversible can be used for either right or left-hand doors; the key does the work of the handles, so that each lock can be used as a lock or latch, or both, with the key alone; the tubular locks are the only form of locks that admit of the handles being made absolutely fast to the door by means of long screws; the tubular locks are secure, reliable, and excel in simplicity of fixing, in appearance and in durability when fixed, in addition to fulfilling every function of the ordinary two-bolt lock; any number can be made to differ with master key to pass.

VENTILATION AND FLUSHING OF SEWERS.

DR. CLARK, the medical officer of health to the Lowestoft Urban Sanitary Authority, has just submitted to that authority an able and lengthy report on the ventilation and flushing of sewers in relation to health. The following are extracts taken from the first part of the report.

After saying he has obtained such information from the medical officers of health of other towns as will he trusts enable the sanitary authority to decide upon some definite policy in regard to the ventilation of the sewers of this borough, he proceeds:—I am informed by your surveyor that there are approximately some twenty-one miles of public sewers within the borough, and these sewers are ventilated by means of a few shafts (9 inches by 6 inches and 6 inches by 4 inches respectively), while there are also 256 manholes and lampholes, of which 81 are closed and 175 open.

It has been laid down as an axiom by Sir Douglas Galton, Sir Robert Rawlinson and others, that public sewers should be ventilated at intervals of not less than 100 yards, so that there should be at least eighteen ventilators to the mile, while the average in this borough is only about ten to the mile. In some towns, however, reference to which is made at the end of this report, the sewers are, I understand, practically unventilated, and I cannot say that the mortality returns of these towns indicate that any serious result has accrued hitherto from this apparent neglect of a duty which the Public Health Act, 1875, imposes upon all sanitary authorities. For some months past I have devoted much care and thought to the consideration of this subject, and I am fain to confess that the stern reality of facts and figures has convinced me that the open manhole, as it exists in this borough, is a standing menace to the health of the inhabitants, and may even be in some cases the actual cause of a disease which was unhappily too prevalent here during the past winter—I mean diphtheria.

A most interesting report has just been issued by Mr. James Mansergh, C.E., a well-known sanitary engineer, upon the ventilation of the sewers at Beckenham, and although it would be unwise to compare such a residential district as Beckenham, where practically the whole of the sewers are of modern construction and well laid, and which has an average of only five persons per acre, with a borough such as our own, where there is an average of considerably over ten persons per acre, yet Mr. Mansergh's report brings out very clearly several most interesting points in connection with sewer ventilation. In the first place the report proves that the multiplication of venti-

lators does not abolish the nuisance arising from surface gratings, for although there is a ventilator at every 82 yards throughout the whole of the Beckenham district, and this, it will be observed, is considerably in excess of the requirements laid down by engineers, yet great annoyance is experienced from the surface ventilators, in spite of the fact that the sewers were proved to be in good condition, self-cleansing and adequately flushed. To quote Mr. Mansergh's own words:—"It cannot therefore be said that the annoyance experienced from the surface gratings arises from a deficient number of ventilators;" and again, "I have no doubt that the flushing and ventilation are sufficient, using the latter term without regard to the offence caused by it." I take it that this is a most important conclusion, since it considerably discounts the argument that if a surface grating is offensive, it is necessarily so as the result of some temporary and removable defect in the flow of the sewage, which should be dealt with by flushing. To again quote this report, Mr. Mansergh says, "The broad result of this part of the investigation is that I have not been able to discover any defects in the sewers which account for the complaints of foul smells." It would appear therefore that sewage, even in modern sewers, will generate evil-smelling gases, and these should therefore be given vent at a considerable elevation in preference to on a level with the roadway.

Another point brought out by this report is that all ventilators, whether at the road surface or as shafts, act both as inlets and as outlets, according to the varying climatic conditions. This fact, which I have frequently asserted, was proved by means of anemometers, and it may therefore be considered as scientifically proved that surface gratings, even in conjunction with tall shafts, act at times as outlets for the sewer gases. The case, therefore, for or against surface ventilators depends upon the strictly medical question as to whether the emanations from moist sewage are or are not dangerous or injurious to health. Personally I have no hesitation whatever in saying that, in my opinion, exposure to the emanations from sewage has a most depressing and injurious effect upon the vitality of the human organism, and apart entirely from the question of the causation of such diseases as enteric fever or diphtheria, which are due to specific germs, that these emanations produce a deterioration of vital activity which seriously predisposes to actual disease. The advocates of surface-ventilators state that their object is to approximate the condition of the sewers as far as possible to that of open sewers; but if it be proved that the emanations from an open sewer, or,

what is similar, from any deposit of night-soil, moistened with liquid sewage, is injurious to health, then surely such an attraction is the least desirable one that any town can offer, whether to visitors or to its more permanent residents.

If the interior of one of those highly glazed earthenware pipes used to form the first syphon of the modern wash-down water-closet be examined after the closet has been in use for some few months, it will be found to be lined with a thin layer of brownish sewage matter which has become adherent to the pipe as the soil was washed through it by the flush of water from the cistern, and it is only necessary to compare the interior of these pipes with the comparatively rough lining of the ordinary glazed sewer pipe to realise how much more of the soil must be retained by these latter. It must also be remembered that for almost two-thirds of every twenty-four hours little or no water passes through the sewers, except in times of heavy rain, and it is easy to imagine how such smells arise as those which emanate from surface gratings, for as this film becomes uncovered by water, it rapidly decomposes, thus presenting much the same condition as the periodically exposed foul foreshore of a sewage-laden river. In times of storm sand and grit are washed into the sewers with the rain and scour the interior of the pipes, removing this decomposing crust for a brief time, and hence it is that after heavy rains these surface ventilators cease for a few days to be offensive. The smells whether from defective house-drains or from surface gratings are to be looked upon simply as warnings, and if such warnings are persistently disregarded, sooner or later ill will come of it.

The result aimed at by the use of the sewer ventilators, which are placed purposely at different elevations, is to freely dilute any noxious vapours that may be generated in them "by causing unceasing motion and interchange betwixt the outer air and the inner sewer," and had we only to deal with the evil-smelling and poisonous gases generated by the putrefaction of the sewer contents, there can be no question that the creation of constant currents of fresh air through the sewers would, in conjunction with copious flushing, be the correct and only remedy. The less movement of the air of sewers we create the less likelihood will there be of any disease-germs being carried into the outer atmosphere; and one of the greatest faults of the modern system of sewer ventilation is this persistent creation of draughts throughout the length of our sewers. We must aim at comparative stillness of the sewer air and be content to provide small outlets here and there, at high elevations, which shall act solely as safety-valves, giving exit to the sewer gas

when the internal pressure is greater than that of the atmosphere, and *vice versa*, admitting air to the sewers when the internal pressure becomes negative. The result of this will probably be that the sewer gas will be more concentrated and therefore more poisonous, resembling, in fact, the gas at the bottom of a deep well, but as it is contained in the sewer and has no tendency to leave the sewer, so long as the internal and the external pressures are equalised by these "safety valves" no harm will accrue, provided that when sewer-men wish to enter the sewer they do first flush that portion which they wish to enter, opening at least two adjacent manholes while they flush. Surely it were better to give the sewer-men a little more trouble before entering a sewer, less trouble, in fact, than they would have to take before descending a well, than to persistently mingle with the air we breathe sewer gases which may and often do carry with them the germs of disease. I know it will be argued that under such circumstances the concentrated sewer gases will be sucked into houses from faulty drains by the aspiration of the fires, &c., but if the by-laws relative to the use of interceptors and all the other restrictions imposed upon builders, whenever drains pass under the houses, are obeyed no such danger could arise; and I can moreover point with confidence to the mortality statistics of those towns which do not ventilate their sewers, as a powerful argument against this theory.

I may add also that the experience of the recent outbreak of diphtheria in this borough, which is practically dependent entirely upon the storm-water for the flushing of the sewers, has demonstrated to me the fact that fresh cases occur almost invariably after two or three days of fine dry weather, the germs presumably drying on the sides of the sewers and being carried by the draughts through the sewers into the atmosphere, and that the occurrence of rainy weather is marked by a temporary cessation of the cases, in spite of the fact that the entrance of the storm-water into the sewers forces out some of the gases into the streets and possibly even into some of the houses.

Dr. Sidney Davies, medical officer of health for Plumstead, has pointed out a striking comparison between the incidence of diphtheria upon the two sanitary districts of Woolwich and Plumstead. It appears that these two districts are contiguous, Plumstead being in reality merely an extension of Woolwich; the former has a population of 55,000 and the latter of 41,000. They are on the same soil, have the same water supply and practically the same milk supply, while the sewage of both districts is discharged into the Southern London Outfall Sewer.

Woolwich has, however, a large proportion of old brick sewers with insufficient fall, while Plumstead has pipe sewers, and is built on the side of a steep hill. The bulk of the houses in each are four or five-roomed with water-closets outside. Woolwich has a good many slums, and its sanitary arrangements are certainly not all that could be desired, while Plumstead has no slums, and its sanitary arrangements are more in keeping with modern requirements. These two districts are under different sanitary authorities, and consequently while Woolwich has no grid ventilators and very little sewer ventilation of any kind, Plumstead has grid ventilators in every street, and the sewers are also ventilated by shafts. Such being the conditions of the two districts, Dr. Davies proceeds to point out that during the past four years, Plumstead with its better sanitary arrangements (bar the grid ventilators) has had three times as many deaths and four times as many cases of diphtheria as Woolwich. Scarlet fever and typhoid fever appear to be equally prevalent in the two parishes, while diarrhoea, which is due not so much to sewer gases and their constituents as to sewage-contaminated soil, is, as would be expected, more prevalent in the Woolwich district where the old brick sewers still exist. Dr. Davies shows that the increase of diphtheria in Plumstead is contemporaneous with the introduction of the grid ventilators, while in that part of the district in which exist shafts as well as the grid ventilators, the number of cases is less than where no shafts exist.

The remedy suggested by many for the purification of sewers and the abolition of the nuisance arising from surface gratings is more copious and more systematic flushing with water, and there can be no question that in addition to the cleansing effects of a sudden rush of water along a closed conduit, that water has immense capabilities of absorption of the sewer gases, and where practicable this is undoubtedly an integral part of the duty of every sanitary authority, although to judge from the report of Mr. Mansergh, it cannot be relied upon to abolish the nuisance of surface ventilators. I cannot, however, disregard the fact that this flushing is most essential in hot dry weather, and it is just at such times that many towns are put to great straits to secure a sufficiency of water for drinking and domestic purposes, and when we see great cities compelled to cut off their water supply for more than half of every twenty-four hours, as several did during the drought of last year, it seems hopeless to rely solely upon flushing for the harmlessness of our sewers, since it is obvious that when most needed the system almost invariably breaks down.

Vol. LI of THE ARCHITECT. Handsomely bound in Cloth, Gilt Lettered Price 12s. 6d.

There is less excuse in this respect for such towns as are contiguous to the sea, and I have very little doubt that in years to come these towns will value their potable water far too highly to pour it into their closets and sewers, and that a separate service of sea water, which can be had for the pumping, will be utilised for all such purposes.

VENTILATION AND WARMTH.

AN interesting article on the above subject appears in the current number of the *Lancet*, which deals with the subject from an impartial point of view. The writer says:—Everyone must admit that our present systems of heating are far from satisfactory, and that many of the existing methods of ventilation are crude and clumsy if not often dangerous, and yet there are but few indications of steps being taken to effect any real improvement. Progress, indeed, in warming and ventilation, especially in this country, is practically barred by prejudice and the fixity of sentiment. As far as the heating of large buildings is concerned, however, this sort of objection may be waived, since it is in the home chiefly that the Englishman cherishes the open system of firing with its cheery glow, which in his mind in the dark, dreary evenings of winter is associated with and is symbolic of comfort, hospitality and welcome. We have already shown how the question of sentiment may be set at rest by the adoption of appliances which are satisfactory also from the scientific, sanitary and economical point of view.

It is evident that if draughts could be properly controlled, and could conveniently and economically be converted into warm, unvitiated currents of air, we should possess an admirable means of heating and ventilating our dwellings, and many an invalid and delicate one would be spared the dread of the approach of winter. Such is practically the end in view of a system of heating and ventilating which has quite recently been brought to our notice by Mr. John Grundy, of 30 Duncan Terrace, City Road, London, and Tyldesley, near Manchester, who, though he emphasises the advantages to be gained by the use of a central heating apparatus (which is also smoke-consuming), has further given his attention to ordinary grates so constructed as to consume smoke, thus obviating loss and waste of heat and economising fuel. The Grundy system of heating buildings, which aims also at supplying fresh warm air in the rooms of dwellings, is, with its improvements, embodied in the apparatus about to be described. A working model of

this apparatus was exhibited recently at the Agricultural Hall. The heating chamber is conveniently located in the basement of the building, and very little bricklayer's work is required, it is stated, to complete its setting. The air enters from the outside by a screened window into the fresh-air chamber, where any dust carried in with the air can settle down, and is then admitted by a sliding door or throttle-valve into the fresh-air passage, and thence to the heating chamber. The fresh-air passages can be entered by an attendant through the access-door for the purpose of cleaning out whatever may have been carried in from the outside, and the access to the heating chamber proper by the door provided to clean the apparatus itself and the heating chamber, which should be done at the beginning of each winter. The pure warm air passes along the ceiling of the heating chamber and enters into the vertical or horizontal flues leading to the rooms to be heated. Each room has a separate flue, with a warm-air inlet about 6 feet above the floor. The vitiated air is removed by a separate flue leading above the roof and having exhaust valves, one a little above the floor for winter ventilation, and another immediately below the ceiling for summer ventilation. Although it is possible to regulate the total heat produced in each heating chamber by the quantity of fresh air admitted, it is yet impossible to warm all the rooms equally and ventilate them properly as well, for some rooms being less exposed naturally attain the desired temperature sooner than others. In some rooms the temperature may rise rapidly on account of gas flames or of a large number of people being assembled, and it is therefore of importance to give each room warm or cold air just as may be required to attain this. The fresh air channels begin below the ceiling of the heating chamber and are connected with the fresh air passage. In each fresh air passage there is a mixing valve regulated from without, by which pure cold and pure warm air can be mixed in any proportion. When the heating begins these mixing valves are closed, but as soon as in any room the temperature threatens to rise above the degree desired the mixing valve is opened so as to admit sufficient cold air to counterbalance such an excess and the exact degree desired can thus be obtained and maintained. By means of a throttle-valve placed in the warm air flue a room may be completely cut off from all heating and ventilation. When desired the in-coming fresh cold air, prior to passing through the heating chamber, can be filtered in a very simple and perfectly automatic manner.

This description only conveys a general idea, but obviously

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of so admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 60 coloured folio plates, difficult to distinguish from the original, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRI BEYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 1

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The third year of the New Series (1893) is in preparation, and will form the eighteenth year of the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

H. J. & C. MAJOR, LTD., THE PATENT TILE WORKS, BRIDGWATER

Are the Sole Manufacturers of

C. MAJOR'S PATENT WEATHERPROOF ROOFING TILES

That have been first in every competition since 1885.

ALSO OF

C. MAJOR'S PATENT INTERLOCKING PLAIN AND FANCY TILES, that supersede all Tiles of the Broseley type.

None of MAJOR'S Patent Tiles require Nails to Fix them, nor Cement or Mortar render them Efficient on the Roof.

Full particulars will be sent on application, and copies of Testimonials, showing that in the opinion of Architects, Engineers, Land Owners, Estate Agents, Merchant Contractors, and others, the above-named Tiles are unequalled for Economy, Ornamental Appearance, and General Efficiency.

the carrying out of the work has to be adapted to the special conditions and requirements of each case. The system appears to us to present many important features in regard to the healthy warming and ventilation of dwelling-houses. Thus, according to our observations the air so warmed is not deteriorated by over-heating (in contact, for instance, with hot metallic surfaces), its inspiration produces no oppressive feeling, and it does not become "devitalised" as is the case with so many forms of heating appliances. Whilst, however, we see no reason to doubt the important hygienic advantages which the adoption of such a system would confer, yet we cannot speak from experience on such points as the labour involved in its installation, the expense of outlay and maintenance, or as to how far its application to modern requirements would be really practicable. The application of the system to cathedrals, public halls and dwellings has, we understand, given general satisfaction—a result which is quite in accord with our own observations of its working powers. We need hardly add, however, that we cordially approve of a system which not only aims at the healthy heating of buildings but, at the same time, at providing, suitably tempered, a constant influx of pure fresh air. When properly installed there is no reason to doubt that such is the desirable end the system referred to attains.

EXPLOSIONS IN DOMESTIC BOILERS.

A DEPUTATION representing the Manchester Steam Users Association presented a memorial to the President of the Board of Trade (Mr. Bryce) asking that an independent investigation, such as that held under the Boiler Explosions Acts, 1882 and 1890, in the event of every steam boiler explosion, and also in the event of every heating boiler explosion, should be held in the event of every domestic boiler explosion, so that the true cause of such disasters and the best means of preventing them may be ascertained and published in every case. The deputation was introduced by Sir J. Fergusson, M.P., and there were also present Sir H. Roscoe, M.P., Mr. Holland, M.P., Mr. Weir, M.P., Mr. Adam Dugdale, president of the association, and Mr. Lavington E. Fletcher, chief engineer. The memorial set forth two tabular statements; one showing that owing to the frost in January last as many as 22 domestic boiler explosions occurred, by which one man, six women and three children were killed, as well as four men, 19 women, and six children injured; the second showed that during the frost in

January 1881 as many as 32 domestic boiler explosions occurred, by which three men, three women and three children were killed, as well as two men, 22 women and one child injured. The fact that the Association has recorded as many as fifty-four domestic boiler explosions as having occurred during two short frosts, killing nineteen persons and injuring fifty-four others, while doubtless there were many other explosions, showed the importance of the subject. The cause of domestic boiler explosions was extremely simple, but had been much mystified and much misunderstood. It was very generally supposed that during a frost the boiler ran dry and became red hot, and that on the occurrence of the thaw the water found its way again into the boiler, when so rapid a generation of steam took place and so irresistible a pressure resulted that the boiler was shivered into pieces as with a charge of gunpowder. This view of the case was unfounded. As long since as the year 1867 the M.S.U.A. instituted a series of experiments. Three domestic boilers, two of them of copper and one of cast-iron, were made red hot and then subjected to a sudden admission of cold water, the water being injected in one case through a pipe having a bore of half an inch connected to the water company's main, and in two other cases through a pipe having a bore of 1 inch connected to an overhead tank. In no case, however, did any explosion result. The boilers remained perfectly still and entirely unaffected. In one experiment a safety valve was placed on the boiler, but enough steam was not generated to make it blow, while the feed-pipe was found to get hot for some 15 feet from the boiler, as if the steam were beating back and forbidding further entry of the water. All the attempts to explode the boilers by the injection of cold water failed, though every endeavour was made to succeed, and everything that glowing red-hot plates and cold water could do was done. Further, in the year 1882 the Association instituted a second series of experiments of a somewhat similar character, but on a larger scale. The furnaces of a Lancashire mill boiler 7 feet in diameter and 27 feet in length were made red-hot and then subjected to a shower-bath of cold water, this treatment being repeated again and again. No explosion, however, resulted, nor was there any sudden generation of steam or rise of pressure. Thus this second series of experiments corroborated the results obtained by the previous series, and confirmed the view that no sudden and irresistible generation of steam took place, and that no gunpowder action was set up on showering cold water on red-hot plates. Domestic boiler explosions were

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in
large quantities for Greenhouse Sashes, Public-house Shutters,
and other heavy work. The Manufacturers would recommend
it for its strength, and the large amount of wear in it, consequent
on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND
LINES (two Prize Medals awarded). The Manufacturers of
the above articles particularly wish to draw the attention of
the trade to their Imperial Patent Flax Sash Lines, of which
they are now making six qualities, all of which they can
strongly recommend, as they have given unqualified satisfaction
to the trade for now over One Hundred Years, and the
Proprietors continue to give their personal attention to the
manufacture of these goods.

They also invite the particular attention of the trade to
their IMPERIAL PATENT BLIND LINES, which are very
superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers,
Merchants, Factors and Wholesale Houses in town and
country.

N.B.—Please note that all our goods, as advertised above
are labelled, either inside or outside with our Trade Mark—
"The Anchor."

due simply to a gradual accumulation of pressure in consequence of the outlets being choked. The choking in some cases arose from the accumulation of ice, in others of incrustation, while in others again, where the circulating pipes were fitted with stop-taps, the choking arose from the shutting of those taps. Choking the outlets bottled up the water and steam, so that the pressure went on accumulating until it exceeded the resisting-power of the boiler and an explosion ensued. The remedy for domestic boiler explosions was to apply a small safety valve. The memorialists, however, did not recommend that the adoption of these safety valves should be rendered compulsory. What they recommended was that an independent investigation, such as that held under the Boiler Explosions Acts, 1882 and 1890, in the event of every steam boiler explosion, and also in the event of every heating boiler explosion, should be held in the case of every domestic boiler explosion, so that the cause of such disasters and the best means of preventing them might be ascertained and published in every case. The memorialists did not recommend the compulsory inspection of working domestic boilers, to which objection might be raised by some householders, but simply an investigation after an explosion had occurred, so as to ascertain the cause of the disaster. This would show the householder how to protect himself in future and at the same time disseminate information for the benefit of the general public. It was pointed out that the sufferers from domestic boiler explosions were chiefly women and children living in "jerry-built" and badly-appointed houses.

In reply to the deputation Mr. Bryce said this was a very important question. It involved the lives and personal safety of a large number of people; above all, a class who were perhaps least able to protect themselves—he meant domestic servants. They had no control over the mechanism of the boilers in the kitchens and places where they had to work. Their complaints might go unheeded by the employer, and therefore they were in a special manner entitled to any protection the State might give them. This was also an interesting question as raising large questions of policy. They might have such a theoriser as Mr. Herbert Spencer dwelling on the large steps in the direction of still further State interference involved in the assumption by the State of the duty of inquiry into what happened in a private house. Coming to the practical matter, however, he understood the object of the Association was a purely philanthropic one. They did not propose the State regulation of these boilers, but they considered an investigation

of the accidents arising from them was sufficient to effect their two objects—first, the calling of public attention to the dangers which every basement of a house contained in its boiler, and secondly, to the cause of the explosions. There were two ways of attaining their object—one, as suggested, by an investigation, and the other by making the use of the safety valve compulsory, which latter, as he understood, they did not advise. It would at first sight appear to be the more obviously effective course to require the compulsory adoption of the safety valve if they were satisfied that that would be an efficient remedy than to press the indirect remedy of an investigation.

Mr. Fletcher said he should be glad to see the adoption of the safety valve made compulsory, but there would be much opposition to the proposal. It would also necessitate an extensive system of inspection.

Mr. Bryce, referring to the other proposal of the deputation, said he thought they underrated the opposition that would be excited. He did not say there were not strong arguments in its favour, but the feeling that a man's house was his castle was very strong. As an illustration, he might mention that the only condition on which the Government was allowed to pass the Notices of Accident Bill was the exemption from its provisions of employments in which domestic servants were concerned. Had the Bill passed without this exemption the way of the Association would have been easier, because they could then have applied to him to bring domestic service in the schedule of employments contained in the Bill, and their object would have been attained. That could not be done now. If they liked to try the matter they had better get someone in the House of Lords, where the Bill was pending, to move the question there and have a debate upon it.

Sir H. Roscoe thought the suggestion was a good one.

Mr. Bryce repeated that he did not think the proposal would pass with so little opposition as the deputation appeared to think. It would be only fair, before expressing a decided opinion on behalf of the Board of Trade, that an opportunity should be given to those who held an opposite view to be heard on the subject. It would be well, too, that the deputation should endeavour to obtain more complete statistics on the subject, because if they could show the explosions were increasing rather than diminishing in number they would strengthen their case. He could assure the deputation, however, that the matter would continue to receive his earnest consideration.

The interview then terminated.

CENTRAL FOUNDATION SCHOOLS OF LONDON.

The new wing of Cowper Street Schools, opened by Sir Henry Scott, has been built on what was formerly an open yard, forming an entrance to the playground. The Governors having the necessity of having properly equipped laboratories for the teaching of chemistry and physical science, advantage was taken of this space at the west end of the existing school for the erection of the new additions. The new building is of three storeys with one room on each floor, entered from the end of the school corridors. The ground floor is for the greater portion left open for light and access to basement and playground, and the main front wall of the building over is carried on columns and arches executed in Portland stone. On this floor is a room suitable to be used as an office. On the first and second floors are placed the physical and chemical laboratories respectively. These are lofty rooms of about 33 feet high, amply lit by large windows on two sides, the main front windows facing due north. The chemical laboratory on the second floor has additional light through the open roof from skylights. In erecting the new building the architects had to contend with a source of trouble from the adjoining premises the shape of vibration, caused by heavy grinding machinery. This was overcome in a large measure by completely isolating the new building on the west side where it adjoins the factory, and by using thick layers of felt in the walls under the floors at various levels. It will be seen in viewing the laboratories as now finished that they have been fitted and equipped in a very complete manner. All the fittings have been made from drawings made by the architects, with the advice of Mr. Wormald and the chemistry master, and have been approved of by the Science and Art Department, and are executed in pitch-pine wood with teak tops throughout. The chemical laboratory is fitted to teach thirty-six boys, and each boy is supplied at his place at the tables with gas and water and a special evaporation niche for small experiments. In addition to these, for the general use of the boys, sink cupboards and combustion hood for larger experiments are provided. In the floor of this laboratory are a complete system of drains and pipes, taken from all the tables for waste and exhaust purposes, and all are accessible and under control. The fittings in the physical laboratory are of a similar substantial character to meet the requirements of the teaching. These rooms are heated by low-pressure hot water. Ventilation is provided by means of fresh air inlets behind the heating radiators, with extracts

from the ceilings of each room to the main extract turret in the roof. The building externally presents a simple but effective front to Cowper Street, and is in Suffolk brick and Mansfield stone, with arcade on ground floor of Portland stone. The building and its fittings has been erected from the designs of Messrs. Thomas & Howard Chatfield Clarke, of Bishopsgate Street Within, by Mr. B. E. Nightingale, of Lambeth, in a satisfactory manner, the cost for building and fittings approaching 3,500*l.* The London County Council provided a grant towards the cost of the fittings.

MR. ALDERMAN WHITE, J.P., chairman of the Norwich Technical Education Committee, presided at a public meeting held at the Technical School, Norwich, for the purpose of inaugurating the District Council for Norfolk and Suffolk to act in conjunction with the Worshipful Company of Plumbers, London, in carrying out the national registration of duly qualified plumbers. Among those present were Dr. Cooper Pattin (medical officer of health), Dr. Barton, Councillor Boardman, F.R.I.B.A., Councillor King, Mr. H. J. Green, A.R.I.B.A., Mr. J. Brooks (chief sanitary inspector), Councillor Breese (vice-president of the sanitary committee), and Mr. F. R. Widdows. There was also a large attendance of master and operative plumbers, as well as sanitary authorities and others interested in the question of public health and plumbers' work.

Mr. W. H. Bishop, past master of the Worshipful Company of Plumbers, attended and delivered an address on the principles and objects of registration.

Mr. Alderman White said that there could be no doubt that valuable lives had been sacrificed through bad plumbing, and all citizens would appreciate a movement which went in the direction of good health. He had always felt that the plumbing class was one of the most important and successful sections of the work carried on at the Norwich Technical School, and he was pleased to say that great success had crowned the efforts of the instructor, and that 75 per cent. of the students had passed the examination recently held by the City and Guilds of London Institute.

The following were elected to form the District Council:—

Master Plumbers.—Messrs. T. C. R. King, G. A. King, W. Bird, J. A. Norman, G. Versey, F. W. Rogers, A. Stearn, E. W. Johnson, W. Priest and J. Gooch.

Operative Plumbers.—Messrs. J. Murrell, R. Simpson, W. J. Cladburn, T. Sayer, A. N. Paul, C. Riches, W. J. Taylor, T. E. Sacker, J. W. Curson, and W. Wright.

The Public.—Dr. W. H. Cooper Pattin (medical officer of health), Drs. C. Williams and S. H. Burton, Alderman Ladell

(chairman, sanitary committee, Norwich Town Council), Councillor Breese, Alderman Dakin, Councillor Boardman, Mr. S. Cozens-Hardy, Mr. W. J. Allen, and Mr. F. W. Harmer.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

12848. Thomas Jones and John Charles Jones, for "Improvements in the construction of window-sashes and in sash window-fasteners."

12860. Henry Brooks, for "Improvements in pipes."

12905. Cecil Warburton Knox, for "Improvements in roofing tiles."

12930. Simon Fletcher, James Fletcher and John Duncan Fletcher, for "Improvements connected with windows."

13065. James Alfred Glazier, for "Improvements in or connected with the frames of sash windows."

13074. Siegfried Radleur, for "An improved automatic disinfecting apparatus for water-closets."

13116. John Gordon, for "Method of making glazed bricks, tiles and the like."

13127. Cesare Righini, for "Improvements in or relating to apparatus for flushing water-closets."

13181. George Brindley, James McEwen and Samuel Thompson, for "Improvements in and relating to syphon cisterns and waste-water preventers."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

It is proposed to build a new fish market for Leeds, and the scheme will be considered at the next meeting of the County Council.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

OVER ONE HUNDRED PER CENT. PER ANNUM.

An investment bringing in such a return in these dull days is worthy of attention. In a letter to the YOST TYPEWRITER COMPANY, of date April 4 last, Messrs. PRICE BROS., of Dudley, wrote:—

"As to the objection of first cost, all we have to say is that it has saved the cost of our Machine in less than twelve months."

TRADE MARK

REGISTERED

The Machine referred to as such an excellent investment was a YOST Typewriter. The YOST will yield you the same return that it has brought to Messrs. PRICE BROS.

BUILDING AND BUILDERS.

THE asylum committee of the West Sussex County Council announce that the Secretary of State has approved of the plans prepared by Sir A. W. Blomfield, A.R.A., for the asylum at Horsham, and that the preparation of quantities is being carried out with all possible expedition.

THE work in connection with the erection of the new church at Gretna has been commenced on an open elevated site of a quarter of an acre of ground at the corner of four roads between Gretna Green and Springfield, to accommodate over 200 persons. It is being erected from designs prepared by Mr. T. Taylor Scott, architect, Carlisle. The contractors selected for the various trades are:—Mr. James Rae, builder, Ecclefechan; Mr. A. Tweedie, joiner, Annan; Messrs. Millar & Son, plumbers, Annan; Mr. McCulloch, painter, glazier and decorator, Annan; Mr. C. J. Nanson, slater, Carlisle; and Mr. W. Norman, plasterer, Carlisle.

AT the meeting of the Feckenham School Board sketch plans were submitted by Mr. J. Johnson, architect, for the enlargement of Crabb Cross Schools.

CHRIST CHURCH, Rotherhithe, is to be restored and re-seated, under the superintendence of Messrs. Newman & Newman, F.R.I.B.A., of Tooley Street, London Bridge.

WE hear that Messrs. Newman & Newman, F.R.I.B.A., of Tooley Street, London Bridge, are the architects for the new Mendham Memorial Schools, to be built in Emmanuel Parish, Hastings, for the Rev. Sholto Newman.

THE Hertford and Ware Joint Hospital Board have instructed Messrs. Newman & Newman, F.R.I.B.A., of Tooley Street, London Bridge, to prepare plans for the Isolation Hospital to be built at Gallows Hill.

TRADE NOTES.

THE Paisley Water Commissioners have accepted the offer of Mr. James Urquhart, Shawlands, for the construction of the new filters at High Craigenfeoch, amounting to 4,685*l.* 19*s.* 10*d.* The offer of Mr. R. B. Stewart, Beith, for the cutting of the pipe track, was also accepted at 1,423*l.* 9*s.* 7*d.*

THE new Board Schools, Lower Gornal, near Dudley, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

AN inquiry has been held at Buxton Town Hall respecting an application of the Local Board to borrow 5,000*l.* for the provision of a cemetery, and 1,900*l.* for extension of sewage precipitating tanks. The land for the cemetery consists of twelve acres on the Ashbourne Road, at a cost of 1,200*l.*

THE attention of architects and of all interested in School Board work is called by Messrs. Emley & Sons, Limited, Steam Marble Mills, Newcastle-upon-Tyne, to the growing demand for McMath's patent wash-hand troughs. These are specially in favour in Scotland, where they have been fully tested, and found to be the most efficient lavatories in the market. Among the schools in which they have been recently fixed the following may be mentioned:—Queen Mary Street School, Glasgow; Centre Street School, Glasgow; Thomson Street School, Glasgow; Dalmarnock Road School, Glasgow; Springfield School, Glasgow; Abbotsford School, Glasgow; Adelphi Street School, Glasgow; Galashiels School, Galashiels; Cambuslang School, Cambuslang; Beckford Street School, Hamilton; Row Board School, Helensburgh; Motherwell School, Motherwell; Wishaw School, Wishaw; Hetherston School, Maryhill; Tarbrex School, Cobbinshaw; Coatbridge School, Coatbridge; Dunniker School, Kirkcaldy; Boundary Lane School, London; school at Nottingham; school at Manchester; school at Swansea; Fairfield School, Govan; school at Irvine; school at Abroath; school at Paisley; school at Carlisle; school at Gateshead.

A NEW illuminated turret clock, showing the time upon four external dials and striking the hours, has just been completed at the Accomb new Board schools, near York, for the Accomb School Board, by Messrs. Wm. Potts & Sons, clock manufacturers, of Guildford Street, Leeds, and 22 Collingwood Street, Newcastle-on-Tyne, who are also making one for the Leeds School Board for Hunslet new school, and large clock and chimes for Hayfield Church, near Stockport, and South Kirkby Church, near Wakefield.

MESSRS. KELLEY & CO., artists in stained-glass, 5 Bunhill Row, E.C., desire us to state that although they were burnt right out, and had lost everything in the recent fire in Tabernacle Street, they have got new premises, resumed work, and re-executed the whole of the orders they had in hand, which were destroyed by the fire.

THE following most satisfactory testimonial was received by Mr. Charles D. Phillips, of Newport, Mon., from the clerk of works to Earl Nelson:—"Herewith please find order for 2,000 lock-jaw tiles and ridge. I purchased some from you for a very exposed roof in 1887, and I am pleased to say they have stood all weathers well and keep out both snow and rain, which the plain tiles I removed to place them did not. I am erecting a new building, when I intend using the enclosed order."

MESSRS. PERKEN, SON & RAYMENT, manufacturing opticians, 99 Hatton Garden, so well known for their "Optimus" lenses and appliances, have just now issued from the press the fifth edition of their "Beginner's Guide to Photography." Each edition has comprised 8,000 copies. This last is brought up to date, treating of the most modern apparatus as well as the most recent developers, papers, &c. The manual cannot be too highly recommended for beginners, and, in addition, it is a handy book of reference for formulae, &c., for the advanced practitioners of photography.

WE are pleased to notice the introduction of the Trinidad asphalt pavement into London by the Trinidad Lake Asphalt Paving Company, Limited, 2 Crosby Square, London. The company have already obtained a contract for the paving of Pelham Street in Kensington, which will give ample opportunity to the London paving authorities to judge of the merits of the pavement. The standard pavement of America, now exceeding 1,000 miles of roadway, is made with this material; it is durable and non-slippery. All the great asphalt paving companies of America use it. In Europe it is used in all pavements that are laid in mastic asphalt. It is largely used for cellars, warehouses, mills, maltkilns, breweries, silos, laundries, engine-houses, foundations for high-pressure engines to prevent vibration, stables, tennis-courts, rinks, &c. Flat roofs are rendered fireproof and waterproof by its use. Felt roofing manufacturers were amongst the earliest to utilise the material. Bitumen made from Trinidad Lake asphalt furnishes one of the finest cements known, and can be applied to almost any purpose, from the construction of sea walls to a solution for

Withou Drawer and Pigeon-holes on Top, £10 10*s.*

parquetry. Several patented processes in which Trinidad bitumen largely enters are now extensively used, both for insulating electrical conductors and in constructing the conduits holding same. Bitumen concrete conduits may be said to be the standard system for electric light distribution in London. The damp-resisting properties of the material have rendered it valuable in the construction of bridges, tunnels, railway arches, reservoirs, waterworks, conduits of all sorts, coating for iron pipes, sewers, drains and various sanitary works. It is a deodorant, an antiseptic, a preservative, impervious to acids and elastic.

MESSRS. C. G. WOOD & CO., of 104 High Holborn, London, W.C., have just accepted an agency for London and district from Messrs. O'Connor & Co., Limited. O'Connor's patent hinges and O'Connor's patent pipe joints and ventilating radiators will be kept in stock.

VARIETIES.

AT yesterday's sitting of the Lords' committee on the Tower Bridge Bill, Mr. Baumann, on behalf of the owners of property affected by the betterment clause, moved the insertion of a clause compelling the arbitrator in fixing the betterment charge to allow for any "worsement" caused by the alteration in the value of any property belonging to the same owner, whether such property happened to be inside or outside the area alleged to be bettered by the improvement. This amendment was strongly opposed by the Council as regards property outside the area. The committee, however, decided to insert the amendment.

AT Beltinge, Kent, a subsidence of land has occurred, about an acre, including a public roadway, having sunk to a considerable depth. Other small landslips have occurred in this vicinity from time to time, but this is the most serious. So far the safety of dwelling-houses in the neighbourhood has not been affected.

THE Barnsley School Board have received sanction to borrow 3,841*l.* for works at the Keir Street School.

THE Darton Local Board recently commissioned Mr. W. H. Radford, Nottingham, and Messrs. Duncan & Pickard, Leeds, to prepare schemes of drainage and sewage disposal for the townships of Darton, Kexborough and Barugh. The Board have decided to adopt the scheme sent in by Messrs. Duncan & Pickard, who have been appointed the engineers to

carry out the works of drainage and disposal of sewage. The system of purification is that known as the "Carbonised Refuse System," combining therewith the disposal of towns' refuse (Jagger's patents).

THE *Birmingham Post* says:—Last week the Walsall borough surveyor (Mr. Middleton) received an offer of the surveyorship of Hornsey, near London, with a commencing salary of £500 a year, and there was a fear that his service would be lost to the town. It is stated, however, that the general purposes committee have made arrangements which will probably result in his remaining at Walsall.

AT the meeting of the insaniary property committee of the Liverpool Corporation, it was intimated that the Local Government Board had approved of the obtaining of a loan of 25,000*l.*, which is to be applied to the demolition of insanitary property in the city.

IN connection with the sewage works of Bolton, at a meeting of the committee the engineer, Mr. H. L. Hinnell, reported the result of an interview with Lord Derby's agent respecting the proposed purchase of land for the purpose of carrying out the filtration scheme. It was stated that terms had been arranged for the purchase of Rhodes Farm, Ringley, which covers an area of about 140 acres. The work will be commenced as early as possible after receiving the sanction of the Town Council, and it has been decided to apply to the Local Government Board for sanction to borrow 75,000*l.* for the purpose of the undertaking.

ON August 2 Messrs. Glasier & Son will sell by auction at the Mart, E.C., a valuable freehold property known as the Thorney House Estate, situate in Kensington main road, at the corner of Palace Gate, between the Albert Hall and Kensington Palace, and facing the Board Walk, Kensington Gardens, and comprising an area of nearly 40,000 square feet, and Thorney House, a beautiful detached mansion in Tudor style. The frontages are 446 feet in length, and the ground could be at once utilised for building purposes without disturbing the present house and its gardens. The property can be seen on Tuesdays, Thursdays and Saturdays between two and five o'clock.

IN connection with the annual meeting of the Wilts "Archæological Society at Marlborough, the president, Sir Henry Bruce Meux, has engaged workmen to make a cutting or cross section through the mound or vallum encircling Avebury, with the object of determining the period of its erection. The excavations will occupy about a month.

THE Norwich Town Council have voted a gratuity of 200 guineas to Mr. Buchan on his retirement from the city surveyorship owing to ill-health. It transpired at the meeting also that Mr. Buchan had sent in his resignation without claiming his right for three months' salary.

AUGUST BANK HOLIDAY ON THE CONTINENT.

THE Hook of Holland route to the Continent offers exceptional facilities for visiting Holland and Germany. Passengers leaving London at 8.30 any evening, Sundays included, and Parkston Quay, Harwich, at 10.15 P.M. the same day, by one of the Great Eastern Railway Company's fine twin-screw steamers, are due at Amsterdam, the Hague and the chief Dutch towns early next morning. For the Antwerp Exhibition cheap weekly return tickets will be issued, and should the traffic require it, a second steamer will be run on Thursday, August 2, and Saturday, August 4. Passengers leaving Liverpool Street station at 8.30 P.M. every weekday are landed in Antwerp early the next morning close to the exhibition; and as the last four hours of the voyage are spent in steaming up the river Scheldt, they can breakfast comfortably on board. The steamers leave Antwerp at 6.45 P.M. every weekday, and *table d'hôte* is served on board during the passage down the Scheldt. The General Steam Navigation Company's steamers will leave Harwich at 10.30 P.M., August 1 and 4, and return from Hamburg August 5 and 7.

WOOD v. ASPHALTE.

At a meeting of the Commissioners of Sewers of the City of London, as reported in the *City Press*, it is stated that Mr. Burmester submitted a report from the streets committee on the question of repaving Upper Thames Street, and recommending that one portion of the said thoroughfare, viz. from London Bridge to Queen Street, should be paved by way of trial with Australian wood at an estimated cost of about 2,600*l.*, and that the question of repaving the remainder of the thoroughfare should be adjourned to try the effect of the experiment. Mr. Gordon moved as an amendment that the thoroughfare in question should be paved with asphalt at an estimated cost of 2,400*l.* Mr. Gordon said that wood was objectionable at that point in consequence of its absorbent

nature. Mr. Wallace having seconded the amendment, and concurred with the remarks made by the mover, the medical officer was called upon to give his opinion on the relative merits of wood and asphalt paving. Dr. Sedgwick Saunders said that, after 21 years' experience in the matter, he was still of the opinion that the only clean and useful pavement for the City streets, having regard to sanitation alone, was asphalt pavement. Wood, in his opinion, was about the worst pavement ever invented. As far as Thames Street was concerned, he had often reported on its condition, and he repeated that the only way to improve the sanitary condition of the street was to lay down a hard and jointless pavement. After a desultory discussion on the relative merits of wood and asphalt, in which Mr. Deputy Edmeston, Mr. McCarthy, Mr. Sayer, Mr. Cloudsley, Mr. Berridge and Mr. Deputy Bowring joined, Mr. Gordon's amendment was put to the meeting and carried.

THE LONDON COUNTY COUNCIL.

THE annual address of Sir John Hutton, the chairman of the London County Council, was delivered on Tuesday, July 25. In the course of it he said the building act committee has largely increased, and must necessarily increase with the extension of buildings in London. No less than 6,286 cases of dangerous buildings were dealt with last year. Regulations have been made whereby the height of hoardings used for advertising purposes around vacant land has been restricted to 12 feet. I wish, instead of the hoarding for advertising purposes round vacant land, owners would follow the practice of the Council, the Commissioners of Sewers and a few large owners of land, and erect a palisade fence and prohibit bill-sticking. The matter is of less moment when building operations are in progress. Then, at least occasionally, we have the pleasure of seeing an elegant and artistic building emerging into view when the ugliness of the street hoarding is removed. But to be obliged from one year's end to the other to have before one's eyes the vulgarity and untidiness of a street advertising hoarding is a thing too terrible to contemplate. The duties of the committee with regard to the formation of streets, the naming and numbering of houses, and the thousand-and-one responsibilities devolving upon them have been discharged with skill and despatch. Two hundred and forty-seven sky-signs have been taken down, and 169 licenses for sky-signs have been granted for the limited period defined by the Act.

Portable
Cistern
Filters.

One ingenious evasion of the Act has been frustrated, so that those of us who desire to see London less ugly in the future regard this little measure as a useful aid to the realisation of our wishes.

The highway committee is proceeding to formulate a scheme for the electric lighting of the Thames Embankment. I am glad the Council prevented the permanent disfigurement of that noble thoroughfare by refusing to allow lamp standards to be erected in the centre of the road, and I hope that it will not hurry to adopt lamp standards to be erected on the kerb without good advice and mature consideration as to their design and suitability.

The list of improvements in the hands of the improvements committee, either completed or in progress, includes the four bridges at the Isle of Dogs; Evelyn Street to Creek Road, Deptford; St. George's Place, Knightsbridge; Fulham Palace Road and Queen Street, Hammersmith; Fortress Road, Kentish Town; and Sandy's Row, Bishopsgate, a northern approach to the Tower Bridge. With regard to the southern approach to the Tower Bridge, the insistence upon the application of the betterment principle has delayed this improvement. In the opinion of the Council it is especially a case in which betterment should be made to apply. The Council is quite consistent in its action in refusing to execute the improvement until the principle is admitted by Parliament. Three improvements are mentioned in the report as suggested by the committee, but not agreed to by the Council, and as they stand at an estimated net cost of 2,400,000l., we have not far to seek for a reason for the Council's disagreement. If the rates are to go up by leaps and bounds, and the ratepayer is willing to stand it, then improvements can be conducted upon the old lines to any extent the Council may determine. But are the ratepayers willing to pay all the cost of practically limitless improvements? I think not. Upon this matter they will so soon have an opportunity of speaking that the Council has, in my opinion, done well in restricting its improvements to comparatively small matters, seeing it is no fault of the Council that it has not obtained other sources of revenue.

The water committee have not made much progress in the settlement of the water question. The report of the Royal Commission is of the most unsatisfactory and conflicting character, and the more one knows of the subject the more difficult does it appear to agree with the feelings of the Commission upon many important branches of the question. The appropriation of more water from the Thames, instead of

affording a permanent settlement of the London water question, only postpones the grappling with it a few years, when every difficulty with which the question is now surrounded must be enormously increased. The parliamentary committee is now proceeding to draught Bills, in conference with the water committee, dealing with the acquisition of the undertakings of the present water companies upon fair and reasonable terms, as a step to the equipment of the Council for the discharge of the responsible duty of being the water authority in London.

During the past year some 55,000l. worth of work has been executed and about 180,000l. worth is being proceeded with. The freehold of the central works in the Belvedere Road has been acquired, and new workshops are in course of erection, together with offices, stables, boiler-house and engine-house. It has been found necessary to obtain premises at Princes Street, Walworth, and at Norman Road, Greenwich. The committee are also in negotiation for the purchase of a portion of the land at the south-western corner of Battersea Bridge. Forty-five horses and cobs have been purchased, together with a large quantity of working plant. With regard to the quality of the work done, there are few persons who complain of it. With regard to the cost of such work, some people think that there is more to be said. But are we, as a public body, unwilling to put anything to the credit of quality? Or do we take this position, that while insisting upon quality we at the same time insist upon cheapness? Now, it seems to me that it is impossible to gain both ends, and my preference would be given for the good work—not, of course, with total disregard to cost, but with a due appreciation of the fact that cheapness and excellence are seldom compatible. The one danger and probably the only danger which the works committee has to fear—apart from captious criticism which it can safely refute—is that the workman may not be disposed to do as good work for the Council as for a contractor. Now, if that is so, it is little short of suicide on the part of the workman. I never have understood that the workman was so enamoured of the contractor as to wish to do fairly by him and him only, and I have yet to learn that the British workman will allow the grandest chance that labour has ever had in London to slip through his fingers. It is not improbable that out of 1,700 workmen there may be some who imagine themselves very clever in gaining a temporary advantage by the course I have suggested. Personally I have too much confidence in the workman to think that any such result will follow, and I believe that the works committee will not only justify its

existence, but will prove to other municipalities awaiting our experiment that under proper management this thing can be done, and done to the satisfaction of all parties.

LAYING PIPES.

A CASE has been tried in the Brighton County Court which turned mainly on the question what is a reasonable price for laying drains. The plaintiff, Mr. Langbridge, of Croydon, sued Mr. E. Broadbridge for 25*l.* 7*s.*, work done and materials supplied. Defendant, while denying liability for the full amount, paid 18*l.* 12*s.* 6*d.* into court. Counsel said the work was done in February of last year, and consisted of the connection of six houses in Bolnore Road, Hayward's Heath, with the main sewer. The plaintiff's case was that 156 feet of 6-inch Stanford's patent pipes were laid and jointed, the average depth being 18 feet, and 3*s.* 3*d.* per foot was charged, while the defendant, in paying into court, had calculated 149 feet at 2*s.* 6*d.* a foot. The questions were, first, as to the liability of defendant, and secondly whether the plaintiff's measurements were correct, and whether a proper charge was made per foot.

The plaintiff, a contractor, said in February last year he was constructing a sewer at Hayward's Heath for the local sanitary authority. In consequence of a communication from Mr. Beach, the Local Board's surveyor, he did the work sued for. The soil at Hayward's Heath was a bad one to work in. For 12-inch pipes he was paid 4*s.* 8*d.* per foot by the Local Board, and making allowance for the different cost of pipe, this would work out at 3*s.* 11*d.* for the 6-inch pipe. Mr. Broadbridge declining to recognise his claim, witness asked him if he did not authorise Mr. Beach to have the work done. Defendant replied that he did not know; that the price was too much; that he had an offer to do the work at 1*s.* 6*d.* a foot, and that Mr. May, the Brighton surveyor, told him 2*s.* was plenty to pay per foot.

A brother of the plaintiff, who acted as foreman of the job, deposed to the measurement of the pipes.

Mr. Holman, contractor, Brighton, said he thought 4*s.* a foot would have been a fair price for the work.

Mr. Stone, contractor's agent, said he considered 3*s.* 9*d.* per foot would have been a fair price.

Mr. Nottle, builder, Croydon, said he generally got a little more for such work than the prices that had been mentioned.

Mr. Sawyer, a builder's foreman, described the plaintiff's charge as a low one.

Mr. Beach, surveyor to the Hayward's Heath Local Board, said he met defendant at Hayward's Heath while the main sewer was being laid, and recommended him to have the drains laid to his property while the work was in hand, as they could then be laid at a more reasonable price. Mr. Broadbridge then authorised him to instruct the contractor to do the work.

In cross-examination he said he thought that 2*s.* 6*d.* a foot would be a proper price. His measurement of the drains worked out at 149 feet. Part of this measurement was over the surface, but in that case he had made some allowance for the fall.

For the defence, Mr. Arthur Loader, architect and surveyor, Brighton, said, taking the facts as he had heard them, and considering that the main drain was open, he thought 2*s.* 6*d.* per foot ample.

Mr. Clayton Botham, surveyor, said he thought it might have been done for 2*s.* 3*d.*

Luther French, pipe-layer, said he could do the work for 2*s.* 3*d.* per foot.

Mr. Gold, drainer, thought 2*s.* 6*d.* a fair price.

The defendant was also called, and said he understood at the time that Mr. Beach was going to quote a price for the work before it was done.

His Honour found that the defendant was liable for the amount, but thought that there was an understanding that a low price was to be charged for the work. He considered that the amount paid into court was sufficient to meet the claim, and gave judgment for the defendant, with costs.

HACKNEY MARSH.

ON Saturday Sir John Hutton, chairman of the London County Council, dedicated Hackney Marsh to public use. The marsh is 337 acres in area. The Council have already decided to make a series of improvements which, it is hoped, will effectually prevent the flooding of the land which annually takes place during the wet seasons. Four new canals will be cut connecting the sharp bends of the old river, and suitable embankments will be erected. This will have the effect of converting a portion of the marsh into a large lake studded here and there with islands. These will be suitably planted,

"OPTIMUS" IMPROVED PATENT WIDE ANGLE CAMERA. EXTRA LONG FOCUS.

British Journal of Photography says:—"The present Model Rayment Camera is among the very LIGHTEST actually RIGID Cameras offered to the Public. The RAPIDITY of OPENING and CLOSING is greatly facilitated by additional arrangement for throwing the pinion out of gear from the rack. There is NO CURTAILMENT OF VIEW when of short focus and wide angular aperture are in use."

and will, it is hoped, form one of the most attractive features of the river. It is stated, in a history of the marshes which has been prepared by Mr. John J. Sexby, that the first mention of the marsh in history was in the reign of Alfred the Great, when the Danish Vikings sailed up the Thames and ascended the Lea (then at high water often a mile wide) as far as Ware, in Hertfordshire. Here they built a fortified camp, and sacked the town and adjacent villages. Attempts made by the citizens of London to dislodge the foe proving ineffectual, the king ordered channels to be cut on Hackney Marshes by which the current of the river was diverted, and, the stream being thus rendered shallow, the Danish vessels were left aground miles away from the Thames. Traces of these channels are still to be found in the vicinity of the Temple Mills, and a Danish canoe found near the spot is preserved in the British Museum. Traces have also been found of a Roman highway across the marsh. The marsh is situated in the manor of Lowshold, one of the two divisions into which the Lordship of Hackney was divided. In 1290 Edward I. granted "free warren in this district" to the Bishops of London, but in the reign of Edward VI. Bishop Ridley surrendered the manor to the king, who presented it to his Chamberlain, Lord Wentworth. The land continued in the possession of the Wentworths until its confiscation in 1652. In 1697 it passed into the possession of the Tyssen family. Among the interesting buildings on the land are the Temple Mills at the south-eastern extremity of the marshes, which were originally erected and maintained by the Knights Templars. After the dissolution of that order they became the property of the Knights of St. John of Jerusalem. Near by is the White Hart, an ancient hostelry, said to have been erected in 1513, which still stands open for refreshment, and here a toll-bar—one of the very few survivals of the kind—levies a charge of 2d. on every horse. Another interesting building is the White House public-house, situated in an isolated position in the middle of the marshes.

The Earl of Meath, chairman of the Metropolitan Public Gardens Association, explained the initial steps which had been made to secure the marsh. In September, 1890, the Board of Agriculture issued a draft scheme for the regulation of the marshes, and signified to the Association its intention to hold an inquiry, which was opened at the Hackney Town Hall on December 1, 1890. The London County Council, through its counsel, objected to the scheme unless the outlay involved in the purchase of all beneficial interests was first ascertained and

the sum inserted in the scheme. The London County Council agreed to offer 50,000*l.*, 10,000*l.* of which was subscribed by the Hackney Board of Works, for their purchase. This offer was declined by the vendors, who afterwards said they would accept 75,000*l.* The Council agreed to increase its contribution to 50,000*l.* plus 15,000*l.* subscribed by the Hackney Board of Works. Of the remaining 10,000*l.*, 5,000*l.* was subscribed by Lord Amherst of Hackney. The whole transaction was embodied in the London Open Spaces Act, 1893, which, as it vested the marshes in the Council, did away with the necessity of the scheme proposed and supported by the Association. The Association hoped that the Council would, in time, look beyond the Hackney Marshes, and not rest content until the whole line of marshes from Tottenham to London had been acquired as one vast playing field.

Sir John Hutton said that he congratulated the people of Hackney upon the splendid acquisition which he was about to dedicate to their use for ever. Lammas rights had existed on the marsh, but by agreement between the lord of the manor and the several owners the marsh could at any time have been converted into freehold building land. The action of the London County Council, however, had made every resident of London a tenant for life of the Hackney Marsh. The Council had yet to carry out extensive drainage works in order to give greater facilities for football and other games in the winter months. They would also provide safe bathing pools, plant trees, provide seats and fence in the unprotected portions of the marsh. The Council could not send the people into the country, but it would do its best to bring the country to the people.

DEFECTIVE SCHOOLS.

THE first quarterly return has just been issued, as a Parliamentary paper, of public elementary schools (1) which have been warned by the Education Department under article 86 of the Code, including schools from which the grant has been withheld under that article; (2) which have been warned by the Education Department that the annual grant will in future be withheld unless defects in the school premises are remedied; (3) the annual grants to which have been suspended for three months or more from the date of the receipt by the Education Department of the inspector's report, on account of defects in school premises. Article 86 of the Code states that the school must be efficient, and that the grant will not be withheld under

article unless the inspector at his annual visit reports the school or class inefficient, and unless the Department gives a formal warning to the managers that the grant may be withheld at the next annual inspection if the inspector again reports the school or class to be inefficient. Under the first head there are 5 cases; but the grant was actually withheld in only five. The schools under the second head number 28, and in the majority of the cases the reason given for the warning is "premises unsatisfactory." They are situated in London (3), Berkshire (2), Cheshire (4), Devonshire (1), Herefordshire (1), Kent (1), Lancashire (2), Lincolnshire (1), Middlesex (1), Northamptonshire (1), Oxfordshire (1), Staffordshire (1), Surrey (5), Sussex (2), Worcestershire (1) and Yorkshire (1). Of the 28 there are eight National schools, four Church of England, three Methodist, four Wesleyan, two Roman Catholic, two Board and one general school. The remaining four are not classed. Under the third head there are three schools:—St. James's Roman Catholic School (Reading), Armathwaite (Cumberland) Church of England School and Heskin (Lancashire) Penrith's Grammar School.

THE SOUTH AFRICAN ASSOCIATION OF ARCHITECTS AND ENGINEERS.

The second annual meeting of the South African Association was held on June 27 in Johannesburg. Mr. A. H. Reid, the President, in his address stated that the membership had increased from forty-three to fifty-six, and that the finances were satisfactory. Application had been made for a charter of incorporation, but the Volksraad refused to grant one. Concerning buildings the President said:—It affords me great satisfaction to report that a most marked improvement in the class and quality of buildings erected in Johannesburg has taken place during the past year. The residential buildings recently completed are, as a whole, far superior to those met with in the neighbouring colonies, as regards comfort, sanitation, stability, architecture and furniture. The business premises are even more marked in their improvement, and the town may well be proud of such structures as Henwood's Buildings, the Aegis Buildings, the Gold Fields of South Africa Block, Green's Chambers and many others. The coming year, I know, close upon some equally creditable works, probably superior in style and finish to those of which we are now

proud, but which, on account of the pressure brought to bear upon us by clients, in the matter of time, are not the result of that placid thought which leisure and freedom from worry can alone provide. I am indebted to the courtesy of the town engineer for the following statistics of new buildings and reconstructed works that have passed through his office during 1893 and to date, viz.:—Dwelling-houses 798, business premises 24, shops 96, public halls 5, stores 81, schools 1, stables 71, workshops 11, churches 3, magazines 4, additions and alterations 116, making a total of 1,210 works, or 100 per month. For this year up to the 20th inst. plans for 368 new buildings and 113 alterations have passed through the department, or a total of 481 works. It is marvellous to me and creditable to his department, undermanned as it is, to get through the inspection of so many works without accident or complaint.

In view of the rapid increase of the town, I would suggest that the Council place their services at the disposal of the sanitary board, with the object of producing new and improved building by-laws. The existing ones are practically unworkable, and many new ones are absolutely necessary now. For instance, provisions for the escape of inmates and salvage of goods in case of fire should be made imperative in the immense piles that are now being erected. Access to roofs of all buildings over two storeys high should be provided with hand-rails for safe passage of the inmates of the upper floors in case they are cut off from escape by the staircases. A limit to the height of buildings in streets of varying widths should also be fixed. Regulations bearing upon party walls are most necessary, as the present absurd system of erecting two independent side-walls to each building, and wasting two or three feet of frontage in doing so, cannot, in the face of the value of land and frontage continue. I have just successfully carried through the first party-wall contract entered into in Johannesburg, which I reckon saved my client 300l. and 2 feet in the width of his frontage, and his neighbour the same.

The disfigurement of streets by huge advertisement hoardings has been started and should be suppressed, and the matter of sky signs also requires regulation, and some steps should be taken to curtail the network of overhead telegraph, telephone and lighting wires that are now spoiling the appearance of our streets. Having the honour of being a member of the sanitary board, I shall have much pleasure in introducing any proposed reforms to the attention of that body.

We have during the past year or so been provided with

suitable law courts, hospital, market and police and gaol accommodation, and will shortly have a new post and telegraph offices, but we still dream of a town hall, public offices, fire-brigade station, public bath and wash-houses, slaughter-houses, library, churches, schools, a proper water-supply, drainage system, garbage destructor, town lighting, and last but not least a town clock.

The building trade has been supplied with all labour it required for the past year, and the class of labour is much improved. There have been no strikes or disturbances in the constructive trades, but there have been many serious failures on the part of the masters, involving merchants and employers in heavy losses, and causing both engineers and architects serious annoyance. I attribute most of these failures to a lack of business capacity and capital, combined with incompetence in the matter of estimating. I consider it most necessary that a master builders or contractors' association be formed here for the purpose of keeping the trade together, establishing a business-like routine in the conduct of contracts and in estimating for them, and of providing a competent practical body to whom the professions would look for advice and assistance in case of need. I suggested the formation of such a society years ago, and it was started, but soon died an unnatural death.

The following officers were elected:—President, Mr. C. Aburrow; vice-presidents, Messrs. A. S. Boucher and S. Farrar; members of Council, Messrs. G. R. Andrews, A. H. Reid, J. H. Johns, T. Reunert, J. H. Davies, E. P. Rathbone, J. H. Hammond and E. D. Drummond.

CITY CHAMBERS, EDINBURGH.

SINCE the attempt made in the time of Lord Provost Sir Thomas Clark to provide suitable municipal buildings for Edinburgh nothing very great has been done in the matter, though since that date, says the *Scotsman*, a good deal of accommodation has been added to the City Chambers by the purchase of property on the east side of the Royal Exchange. Property in and about the Exchange has also been picked up as it came into the market, and now the Corporation is the possessor of considerable portions of the tenements on the west side of the Exchange, which would be needed were any considerable extension resolved upon. Some time ago, in view of the fact that with the continued increase of the city's business

there is growing a want of accommodation for committees, that there is great necessity for a new Burgh Court and D of Guild Court, a remit was made to the Lord Provost's committee to consider the whole question of the accommodation for municipal purposes. The matter for some reason drifted into the very capable hands of Dean of Guild Miller, who put himself to an immense amount of trouble in regard to and who in the course of his inquiries into the history of municipal buildings on this and adjoining sites in the High Street has unearthed a great deal of interesting information which in pamphlet form will likely soon see the light in conjunction with Mr. Morham, city architect, he has also prepared a series of elevations and plans showing a tentative way their views as to what might be done with the present buildings, were an extension and reconstruction of them resolved upon. A striking elevation has been made of the back of the lofty tenement, and how it might be made more decorative so as to give it a better appearance when seen from Princes Street. To this end it is proposed to build out a wing on its higher side to the line of Cockburn Street, and also about the point of the present square tower carried a storey above the roof and finished with a mansard roof. The decorative treatment applied to the proposed new wing and the tower is similar in style to that on the front of the building facing the Exchange. It is proposed to annex the large tenement on the west side of the Exchange formerly occupied by the Writers to the Signet and the Heriot office, and the upper storeys of which will not hold on together much longer. Should it all be acquired it would be pulled down, on this site would be reconstructed a new council chamber extending from the Exchange to Warriston Close, and with outlook also to the north. Below it would be a new Burgh court-room, greatly needed. The new council-room is to be about two and a half times the size of the present chamber with a gallery for the public and a reporter's gallery. The council chambers would be converted into a Lord Provost's room, and other parts of the building would be remodelled. The whole scheme is estimated to cost about 50,000*l.*, but was explained by the Dean at the meeting that it could easily be carried out in instalments if that were thought necessary. The committee passed no opinion on the plans, but ordered their exhibition in the chambers during the next few months in order that the members of the Council may see them and make up their minds about them.

LYCEUM THEATRE

THE PATENT FIREPROOF & SOUNDPROOF PARTITION

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of long Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4 brick partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be put up by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

ST. PATRICK'S CHURCH, EDINBURGH.

ANS are shortly to be presented in Edinburgh Dean of Court for extensive alterations on St. Patrick's Roman Catholic Church, Cowgate. The building, then used as a presbyterian place of worship, was acquired by Bishop Gillis in 1755, since which time it has retained its old form. Its sombre exterior, however, has been relieved by frequent decoration and slight internal improvements. Now it is proposed to remove the gallery except a portion on the south side under the tower, to be used as an organ-loft. To make up for the loss of sleeping accommodation thus brought about, the lobbies and staircases will be removed, the present chancel used merely as a "Lady" altar, and the large area so set free furnished with seats. Accommodation is to be found for the principal altar and for side chapels on the north side, the porch on the west will be converted into a baptistery, and a covered way is to connect the presbytery with the church. The architects are Messrs. Buchanan & Bennet, George Street.

BUILDING IN SECLUDED AVENUES.

At the 19th inst. Mr. James Miller appeared at the North London Police-court, before Mr. Bros, on three summonses—for erecting a building in Miller's Avenue—a *cul de sac* in Arcola Street—which was of a greater height than the width of the street; (2) for laying out Miller's Avenue as a new street for foot traffic, which was not in accordance with the regulations of the Building Acts; and (3) for keeping such new street open without the consent of the London County Council. Mr. Bros, giving judgment, said that the case had been several times before the Court and he had thoroughly considered all the facts and points of law involved. The defendant first laid out six houses (enclosed with gates) in 1888, and was summoned by the Metropolitan Board of Works for an offence under the Act of 1861, sections 7 and 8. On that occasion the defendant was represented by counsel, and on the case of the Metropolitan Board of Works *v.* Nathan the summons was dismissed. It was then held that the houses had not been laid out as a street within the meaning of the Act. In 1890 the defendant laid out the rest of the avenue, which was separated from a wall from the six houses already mentioned. Defendant was summoned under the same section and counsel for the County Council cited a new case, but as the magistrate held

that the facts were not the same he dismissed that case also. Some time this year the defendant blocked up the exit of the six houses to Stoke Newington Road and built a warehouse upon the approach. The wall was then removed and the six houses first built were thrown into the newer portion of the avenue, the exit to which was through iron gates in Arcola Street. This warehouse was higher than the width of the roadway of the *cul de sac*, and the Council objected to it, and served the defendant with a notice which set forth that if their requirements were not attended to within seven days a summons would be issued. The notice described the avenue as being a "new street." As a fact, this *cul de sac* had never been held to be a new street, and the defendant not unnaturally came to the conclusion that he could do as he liked with his own property. He nevertheless, as he said, to avoid litigation, complied with the notice, but on the day the Council served the notice giving the defendant seven days' grace they issued a summons against him. As the defendant at once complied, the magistrate thought that the summons should have been withdrawn; but the Council thought otherwise, and pressed for a decision. He therefore held that, as the *cul de sac* in question had not been held to be a new street, the summons with reference to the height of the building could not lie, and he dismissed it. The matter might very properly have been left there. But the Council had seen fit to take out the other two summonses, and again bring before the Court a matter which was decided six years ago. Their excuse was that the circumstances had altered. He had viewed the place again, and had come to the conclusion that the condition of things was technically the same now as when he first had the matter before him. He held that the matter was *res judicata*, and he dismissed the other summonses also. It was ultimately arranged that the magistrate should consider an application for a case on the first summons, and that, in the meantime, the other two summonses should stand over.

LEEDS TOWN HALL DECORATION.

UNTIL the last few days, says the *Leeds Mercury*, the work of decorating the Leeds Town Hall has gone on almost unseen. The interior has been filled with a forest of scaffolding, leaving little visible but an impenetrable network of poles, spars and planks, among which the workmen were only here and there to be seen, the roof being altogether obscured. For some days

past the work of removing the scaffolding has been steadily proceeding, and although the lower portions of the hall are as yet unfinished, the general effect of Mr. Crace's work is now visible. Some description of it will be interesting. The main object of the decorative scheme, as originally explained to the town hall committee by Mr. Crace himself, has been to do justice to the features and proportions of the architecture; to use such colouring and contrasts as would to some extent combat the too frequent gloom of our atmosphere; and lastly, to so arrange the colours as to produce an effective result by artificial light as well as by day. A visitor to the hall will notice the great semicircular vault of the roof with light tones of cream white, broken by mouldings and ornaments in gold and gold colour, and pierced by the square sunk panels or "coffers" of blue as a background to the large rosettes which occupy them. The vault is divided in its length into five bays by broad borders of bronzed laurel-leaf enrichments confined by wide gilt bands, the division corresponding to the position of the double columns below. These columns are painted in imitation of red marble, a treatment adopted originally by the architect of the building when it was first completed. Had there then existed the facilities which now exist for procuring coloured marbles, no doubt Mr. Brodrick would have been glad of the real thing, for it was his expressed intention that they should appear as coloured marble. The red tone of these is the keynote of the decoration. It appears as a ground to the ornament of the frieze and again in the arched linings of the windows, whilst it also marks out the semicircular ends of the hall as the ground colour of the inscriptions. There is no doubt that it does much to cheer and warm the interior, and affords a valuable contrast to the light tones of the roof and the buff panels of the walls. The capitals of the columns are bronzed and richly gilt, and the door dressings, the front of the new gallery, and some other features are similarly treated. Whilst the gallery inevitably shortens the hall, it must be admitted that the architect has dealt with it so as skilfully to minimise that drawback, and a handsome ceiling is now fixed beneath it. This, of course, is in complete shadow, and is therefore decorated entirely in soft shades of white. The vestibule is now in Mr. Crace's hands. Here the scaffold shuts out all but fragmentary peeps, which show that the treatment is not unlike that in the hall, but with deeper colouring. A visitor to the hall will hardly realise its great size. The mere erection of the scaffolding and its removal is no small matter. Upwards of 500 poles were

employed, besides boards, ropes, &c. This work has been well performed by a local firm, Messrs. Mountain & Son. The superficial area of surfaces to be painted or gilt is startling. The wide gilt bands which border the arches, dividing the main roof into bays, are each more than 4 inches wide, and their total length is about half a mile. They are gilt "solid." There is half a mile of one 3-inch moulding surrounding the panels of the roof, whilst the run of painted margins in the roof amounts to a mile and a half. The work is expected to be completed in about a month.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

13233. John Edward Morton, for "An improved fastening for gates and doors."
 13292. Thomas William Twyford, for "Improvements in water-closets."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.
Number of Patent, 16,610,
Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

Telegrams:—"Robert Adams, London."

No. 208. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

SEVENOAKS.—Aug. 4.—For Building Board School and Master's House. Mr. Thomas Potter, Architect, 49 London Road, Sevenoaks.

SIDDAL.—Aug. 8.—For Building Wing to Board School, Messrs. Horsfall & Williams, Architects, 15 George Street, Halifax.

TRADE NOTES.

THE St. John's School, Bristol, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE parish church, Alvaston, Derbyshire, has just been enriched by the addition of a large chiming clock and peal of bells, the whole being the gift of Mr. W. Bradshaw. The clock is fitted up with all the latest improvements, and was made by Messrs. John Smith & Sons, Midland Clock Works, Derby. The bells were from the foundry of Messrs. Taylor & Co., Loughborough.

WE are informed by Mr. Arthur V. Rutty that, for the executrix of the late Mr. Geo. G. Rutty, he would begin the scarifying of the roads in the Royal parks for Her Majesty's Commissioners of Works with his latest improved patent macadam road scarifier on August 1. The total area to be scarified is from 120,000 to 130,000 superficial yards. The machine will be working continuously for the next six or seven weeks, commencing with Hyde Park.

THE directors of Perry & Co., Limited, steel pen makers, have resolved to pay on September 1 an interim dividend on the ordinary shares for the first six months of this year at the rate of 10 per cent. per annum, free of income-tax, being at the same rate as for the corresponding period last year. The half-yearly dividend on the preference shares will be paid as usual at the fixed rate of 5 per cent. per annum.

BUILDING AND BUILDERS.

At Glasgow, Sheriff-Principal Berry, on appeal, has confirmed the decision of Sheriff Mair against the Rawyards Coal Company, Limited, finding them liable to the trustees of the late Robert Aitken, spirit merchant, Rawyards, in 293*l.* 10*s.* and expenses, for damages to property known as the Old Toll Buildings through the mineral operations of the company, with additional expenses.

At the Govan Dean of Guild Court, Mr. J. G. Sharp, house factor, Glasgow, applied for authority to erect eleven tenements of dwelling-houses at the corner of Holm and Sharp Streets. The Clyde Trust objected to the lining on the ground that the fear was bound by his titles to make Holm Street 50 feet wide instead of 28 feet, as was proposed in the plans. The burgh surveyor also objected, contending that the 28 feet street in the plans was not wide enough. The case was continued for a fortnight.

At the Edinburgh Dean of Guild Court twelve warrants were granted, to Rev. Monsignor Grady to make additions to St. Patrick's Church, South Gray's Close; Archbishop Macdonald and others, for the making of a subway leading from the Roman Catholic Cathedral, Broughton Street, to the new presbytery, in connection with the extension of the cathedral; the North British Railway Company for the erection of a bridge at North Back of Canongate, in connection with the extension of the Waverley Station.

The tower of Norton Church, near Yeovil, has been destroyed by lightning, the damage done being estimated at 1,000*l.*

THE annual report of Mr. Hainsworth, inspector of buildings, which has been prepared for the building clauses committee, the *Leeds Mercury* says, shows that the 2,017 new buildings approved include nine villas, thirty semi-detached villas, 586 through houses, and 1,392 back-to-back houses. Among forty-five miscellaneous plans were two churches, four chapels, one addition to church, two additions to chapels, five mission-rooms, a synagogue, four schools (two with swimming-baths attached), seventeen additions to schools and other buildings of a public nature.

A SERIOUS fire has occurred in Liverpool in the Edward Street corn and rice mills of Mr. F. Dresser. The buildings, with valuable machinery and large stocks of grain, were totally destroyed, the damage amounting to about 20,000*l.*

At the meeting of the Birmingham City Council, the health committee were authorised to expend 38,000*l.* in extending the scarlet-fever hospital in Western Road, Spring Hill, and the proposal of the free libraries committee to erect a library for Balsall Heath, at a cost of 5,500*l.*, was sanctioned.

THE Liverpool Corporation surveyor is to receive 75*l.* per annum for periodical inspection of theatres and places of amusement licensed by the corporation. The salary of Mr. Shelmerdine is about 1,100*l.*, and he has a deputy who receives 500*l.*

ELECTRICAL.

At the meeting of the Mersey Docks and Harbour Board the warehouse committee recommended the establishment of a system of electric lighting at the Albert Dock warehouses, at an estimated cost of 2,050*l.*, and the docks and quays committee proposed to fit up sheds at Wallasey Dock, and to connect them with the Birkenhead foreign animals wharf, at a cost of about 4,450*l.*

THE electric tramway from Douglas to Laxey, Isle of Man, has been formally opened to public traffic.

YESTER HOUSE, the seat of the Marquis of Tweeddale, is being fitted throughout with the electric light, water power furnishing the energy necessary to drive the dynamo. The latter will be situated at the mains, about half a mile distant from the mansion, to which connection will be made by means of an underground cable. There will be a battery of accumulators for maintaining the lights when the dynamo is not running, and altogether some 300 incandescent lamps will be employed.

THE North Cliff at Bridlington Quay has just been lighted with electric light for the first time.

THE electric works at Hanley were opened on Thursday. The contract was taken by Mr. Cornelius Cornes for the erection of the requisite buildings at the generating station. The electric works are situate on land belonging to the Park estate, on the south side of Clifford Street. The main block has a frontage to Bethesda road of 85 feet. The main engine-room has a length of 68 feet, a width of 35 feet 6 inches, and a height at sides of 25 feet.

THE lighting arrangements of Leeds parish church will be fully completed by the 12th inst. The church will be partly lighted by electricity on Sunday.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the prettiest catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

440.—English Carved Oak Writing Table, Leather Top, on Casters, £15 10*s.*
Drawer and Pigeon-holes on Top, £10 10*s.*

VARIETIES.

MR. J. F. BENTLEY, of John Street, Adelphi, has been entrusted with the preparation of plans for the Roman Catholic Cathedral to be erected in Westminster. The building is to be in the style of the early basilicas, and adjacent will be a monastery for Benedictine monks.

THE foundation-stone of the Metropolitan Asylums Board's new fever hospital at Shooter's Green has been laid. It is estimated to cost 200,000*l.*, or 400*l.* per bed.

"DYNAMO Attendants and Their Dynamos" is a thoroughly useful and exhaustive treatise by Mr. Alfred H. Gibbings, A.I.E.E., just published by Mr. Sidney Reutell, 29 Ludgate Hill, E.C. The treatise runs to over fifty pages. The matter dealt with has already mainly appeared in the form of serial articles in our contemporary *Electricity*. As the information given by Mr. Gibbings has been much appreciated, he has been well advised to publish it in book form.

THE export of timber from Norway, which in 1891 amounted to 1,931,561 cubic metres, was reduced in 1893, according to official statistics, to 1,686,505 cubic metres.

MESSRS. TURNER are now showing in their Bond Street Gallery—a long, handsome, well-lighted apartment—some large and valuable works of art, consisting of articles of bedroom furniture wrought in porcelain, fancifully designed and elaborately executed in form and colour. It was Mr. Hales Turner's idea not only to produce washstands, dressing-tables, basins, ewers and trinket sets in porcelain, but also to assign to each article a genuinely artistic shape, and to decorate and adorn it after a definite and coherent plan, poetical and other stories being illustrated. The gallery has been sumptuously and gracefully decorated by Messrs. Oetzmann & Co., of Hampstead Road, each of the four porcelain suites being set off by an elegant scheme of plush and silk drapery, the same stuffs being lavishly used in the decoration of other portions of the room, and the ceiling being hidden by an arrangement of light-blue silk, so disposed as to create a sky-like effect.

THE Liverpool City Council have agreed to offer 17,650*l.* to the Government for the site of Kirkdale Gaol and buildings, the site to be used as an open space.

AT the meeting of the parks committee of the Edinburgh Town Council it was agreed to increase the estimates by about 50*l.* to provide for the enlargement and improvement of the skating-ponds at the Braids, and for the erection of a bowl-

house at the East Meadows in connection with the bowling-green there.

AT the meeting of the Carnarvon Town Council Mr. Lloyd Jones was elected borough surveyor.

AT a meeting of the Liverpool City Council the following recommendation of the insanitary property committee was adopted:—"That the Council place at the disposal of the insanitary property and artisans' dwellings committee the sum of 25,000*l.* for the purchase and demolition of insanitary property, and that the purchase of the following property be approved, viz.:—Ford Street—Nos. 30, 31, 32 and 33, Nos. 1 to 6 in No. 9 court, and Nos. 1 to 6 in No. 10 court."

NOTES ON NOVELTIES.

"Best" Paper Fastener.—No office should be without a supply of this most convenient and simple paper fastener, Crocker's patent. It is most simple and easy to apply. The papers are placed between the fastener, which is squeezed together by the finger and thumb, and the grip on the papers will be found to be perfect. No holes need be made before the fastener is applied, as is the case with the common paper fastener. There are no pointed legs projecting out to scratch and damage or to get entangled with other matters. The fastener is easily released, and when removed leaves no unsightly holes, damaging the papers. The fastening or binding being effected near the edge of the papers, all writing thereon is visible without undoing the fastener, and the "Best" fastener assists to align the papers which are to be secured together.

NEW SCHOOL, SALFORD.

THE Salford School Board having recently invited competitive designs from five firms of architects practising in Manchester and Salford for the erection of a new school, Marlborough Road, Hightown, have chosen for execution the scheme submitted by Messrs. Woodhouse & Willoughby, of 100 King Street, Manchester. Provision is made for 370 scholars, 450 infants on the ground-floor and 420 girls on the first-floor. A gymnasium and cookery-room are also provided. The school is on the central hall principle. The front elevation is intended to be faced with Ruabon stocks and terra-cotta. A mechanical system of heating and ventilating is contemplated operating from the basement by means of fans. The estimated cost is about 9,000*l.*

p. 26.

HALLIDAY'S CLAPTON LIGHTS.

Simple, Powerful, Economical. Reflection and no Complication.

OPEN TOP, AS SHOWN, OR VENTILATING. PLAIN OR ORNAMENTAL.

Much used in Places of Worship, Lecture Halls, Board Schools, Shops, Large Offices, Markets, &c. Suitable for wherever a Very Powerful, Well Diffused, Soft, Economical, and Easily Managed Gas Light is desirable. Made in Five Sizes.

HONoured WITH SUNDRY IMITATIONS.

Seven years from Invention up to April 1890 over 11,300 sent out. But Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong."

R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

J. C. HALLIDAY, 12 GRAINGER STREET, NEWCASTLE-ON-TYNE.
INVENTOR AND MANUFACTURER.

BROOK HOSPITAL, SHOOTER'S HILL.

THE ceremony of laying foundation-stones is one that we always are disposed to assist in, for although we can take no responsibility in the rearing of the superstructure, we feel that officially we are called upon to see that this initiatory step is satisfactorily performed and that the solemn declaration "well and truly laid" is not omitted at the right moment.

Rarely in our experience has the public taken part in a more interesting stone-laying than that of Wednesday last, when at the invitation of the Metropolitan Asylums Board, we were present at the Shooter's Hill site, in company with a distinguished circle of public men from all parts of the United Kingdom.

The Board had very considerably invited the members of the British Institute of Public Health, whose congress in the Metropolis has been a feature of the week, and the president, Professor W. R. Smith, with a large contingent of his colleagues, were present.

No expense had been spared in providing an ample supply of carriages to convey the visitors from Blackheath Station to Shooter's Hill, and the whole arrangements for the reception and entertainment of the guests were simply perfect.

It hardly comes within the scope of our report to particularise the well-planned programme which was carried out with punctuality and precision, but we will just remark that Sir Edwin H. Galsworthy, the chairman, gave a most interesting *résumé* of the important work accomplished by his Board during the twenty-seven years it had been established.

The great increase of the population of London and the compulsory notification of disease, together with anxiety of the general public to avail themselves of hospital treatment, necessitated these large additional buildings. Though, in the first instance, the cost was considerable, the saving of the lives of bread-winners reduced the probabilities of pauperism, and thus the annual Poor Law expenditure was lessened. He was glad to be able to assert that the strong prejudice of the public against these hospitals in their neighbourhood was lessening, and in securing the present site there had been practically no local opposition.

Sir E. H. Galsworthy alluded with pleasantry to the proposal made by some of the busy members of the London County Council that they should absorb the Metropolitan Asylums Board, and whilst admiring their ambition for enlarged functions, he ventured to think that the twenty-seven years'

experience his Board had had was too valuable to be thrown away.

Following his speech and the chaplain's prayer (Rev. J. C. Leck), Lady Galsworthy, with special grace and unhesitating precision, laid the stone in proper form under the skilled and critical eye of the architect, Mr. T. H. Aldwinckle, F.R.I.B.A., of Westminster.

A further interesting address by Mr. A. C. Scovell, J.P., and complimentary speeches by Professor W. R. Smith and Mr. J. Brown closed the proceedings.

At a later part of the afternoon Sir Edwin H. Galsworthy alluded in most eulogistic terms to their architect, who had been unanimously appointed to plan and superintend the construction of the entire scheme.

His previous work for the Board, and especially in the erection of the Fountain Temporary Hospital, Lower Tooting, built and opened in nine weeks, had in the past indicated his special knowledge and mastery of the Board's requirements; and as Chairman he had no doubt that in this instance Mr. Aldwinckle would even excel past achievements.

The architect's response to this public recognition, though brief, indicated his appreciation of the Board's marked confidence in him, and the assurance was expressed of success in carrying out all the important desiderata, as far as the building could do so, to save life and effect speedy cures.

A subsequent examination of the plans showed that the hospital would occupy about 22 acres, leaving a further 10 acres uncovered with buildings—a wise precaution. Accommodation will be provided for 500 patients suffering from scarlet fever, enteric fever, or diphtheria. Not only will there be separate pavilions for each of these diseases, but the wisdom of having several isolation and separation wards for patients is fully provided for.

Much care has been taken to secure the comfort and maintain the good health of the officers, nurses and servants of the establishment (numbering probably 300), a point to which the Chairman feelingly alluded in his opening speech. The all important questions of drainage, comprising something like nine miles of drain pipes of various kinds, utilisation of rain-water from the roofs for laundry purposes, soil drainage, in no way connected with the rain-water drainage, and the simple yet well-ordered system of ventilating by means of vertical glazed-brick shafts with steam coils inserted to obtain upward draught, warming the whole of the wards, rooms, corridors, &c., appear to have received the most thoughtful care on the

part of the architect and the committee charged by the Board with the responsibility of the erection.

Due regard appears to have been paid to the non-absorbent character of the floors and walls of rooms where water will necessarily be used, glazed bricks and impervious tiling being provided for.

Teak, wax polished, has been selected as the most suitable wood for the floors of all infectious wards.

Notwithstanding that the utmost judicious economy will be observed, the cost of the hospital, including officers' residences, stations and stables for twenty ambulances and horses, boundary-walls, drains, roads, electric-lighting, &c, will amount to nearly 200,000/.

The elevation, though not without architectural merit, is free from elaboration, and has been treated more from a substantial and useful point of view than from that which is ornate.

The site being on high ground, preference has been given to the well-known hard red-facing bricks made in the Leicestershire district as offering the greatest possible resistance to the weather.

The fact of the land sloping towards the south will to a great extent facilitate drainage by gravitation. It is noteworthy that as the whole of the establishment will be divided into infected and non-infected areas (the latter embracing the entire administrative department and stores), visitors and others from the outside will neither enter nor come in contact with the infected section.

The contractor for the bulk of the work is Mr. Charles Wall, of Chelsea, who has few equals, perhaps, in constructions of this class. Messrs. Shillitoe & Sons and Messrs. H. Wall & Co., have also been selected to complete certain parts of the building.

THE TOWER BRIDGE.

DURING the first fortnight the Tower Bridge has been opened 1,173,645 foot passengers and 61,257 vehicles passed over it. The bascules were raised 273 times, and 329 vessels passed through the opening. The number of pedestrians on the first three days and on the two Saturdays and Sundays was no doubt largely made up of sightseers, but this remark does not apply to the vehicular traffic. This is now about one-third of what was the total daily vehicular traffic on London Bridge before the Tower Bridge was opened, and is a much larger proportion of the heavy waggon and van traffic. The result is naturally a most perceptible relief to London Bridge. The average detention of the land traffic by the opening and shutting of the bascules is not great, being usually considerably less than a daily average of ten minutes for the double operation, except on the two Sundays, when the great crowds of 147,000 and 156,000 people no doubt tended to increase the time required for clearing the bridge.

QUARRYING METHODS OF THE ANCIENTS.*

THE methods of obtaining stone for general building purposes by the ancients have become known to us by the explorations which have been made in the early Egyptian quarries, and in what may with propriety be called stone-mines. Of the latter, the workings at Tourah and Massourah, in the Mokattan range of hills, south of Cairo, from which the whole of the limestone used in the Pyramids was obtained, are good examples. These stone-mines were opened and worked in this way:—

A gallery about 20 feet wide and high was run from the face of a cliff, in a carefully selected stratum of rock (in this case a fine-grained nummulitic limestone) deep into the heart of the mountain. In driving this gallery the workmen excavated a recess or "heading" at its top, high enough for them to work in, and of the full width of the gallery, and they carried this heading far enough forward to enable them to cut a groove vertically downward behind the first block of stone that was to be taken out. While this was being done, other workmen were cutting vertical grooves on each side of the gallery from

the heading to the gallery floor. At the same time a groove was cut at the level of the floor connecting the two flanking grooves. The mass of stone bounded by the three grooves and the heading was then divided into such sized blocks as was desired, the upper block being first removed, and as soon as it was out of the way the heading was pushed forward. After the entrance gallery had advanced a sufficient distance from the face of the cliff, another gallery was opened at right angles to it and extended on either hand; and at the distance of 20 feet another gallery was driven parallel to the last, and still other galleries parallel with the first, until finally, by a rectangular system of intersecting galleries, a very large space in the interior of the mountain was converted into an enormous hall, the roof of which was supported by pillars 20 feet square, standing 20 feet apart.

The stone excavated was all removed through the entrance of the first gallery, which was often at a considerable height above the base of the cliff, a ramp having been constructed from the entrance of the workings down which the stone was dragged on sledges by men or oxen. The ancient quarrymen, in driving galleries, were accustomed to trim the roof to the required level, and on it was then drawn a centre line in red, and the sides of the gallery were then trimmed vertically in planes parallel to this centre line. The open quarries of Egypt are vast *intaglios*, cut deep in the living rock by a skill whose evidences in tool-marks and drill-holes, in the selection of good materials and the rejection of bad, remain after the lapse of more than three thousand years to excite our wonder that such achievements were possible without the aid of powder-drills or explosives.

Granite in large masses was always obtained by the Egyptians from open quarries, the most famous of which were at Syene (hence the word "syenite," designating a variety of granite composed of quartz, hornblende and feldspar) in Upper Egypt, near the first cataract of the Nile. The methods adopted for the horizontal quarrying of granite blocks of ordinary size was to cut a narrow groove 2 to 3 inches deep parallel with a vertical face of rock at such distance as the width of the desired stone required. In the bottom of this groove rectangular holes were made, about 2 inches long, 1 inch wide and 2 inches deep. These were usually placed about 4 inches apart. Dry wooden plugs were then driven tightly into these holes, and the spaces between them in the groove first mentioned filled with water, and the expansion of the plugs as they absorbed this water split the stone in the line of the holes. No more uniform and simple application of sufficient force for the purpose could possibly have been devised.

The Egyptian method of quarrying out an obelisk from a granite ledge is well illustrated by the enormous partially-finished monolith still remaining in the quarry at Syene. This obelisk would have been if completed (it is still attached to the floor of the quarry) larger than any now known. According to Wilkinson it measures 95 feet long and is 11 feet 1½ inch square at its base, and weighs 1,540,000 lbs., or 770 net tons. It was brought to its present condition by carefully excavating the rock on either side of it, dressing the sides and upper surface to their intended form, and running a groove along each side next to the floor of the quarry, preparatory to the introduction of wooden plugs for separating it from the bed-rock in the manner already stated. But these plugs have never been fashioned, and the vast mass has told the succeeding generations, for unknown thousands of years, of the technical methods of men who wrought long prior to the time when "Solomon's builders and Hiram's builders and stone-squarers" gave dimensions and beauty to the silently-assembled details of the grand temple of the wise king.

Hindustan abounds in examples of rock-cut or quarried temples and shrines. The "Kylas" temple Ellora is cut out of the solid granite rock with wonderful skill and elaboration of detail. The quadrangular pit in which this temple stands has on its sides and rear end (its front being open) rock-cut colonnades and cloisters, the columns of which support the perpendicular rock above. This temple is supposed to have been quarried out to commemorate the triumph of the Sivites over the Buddhist faith. Lanka Cave, Ellora, India, is another excellent example of Hindu quarrying. This rock-cut cave is in the immediate vicinity of the "Kylas," a portion of which can be seen at the right of the right-hand columnar pier. The Buddhist "Chaitya" Cave, or cave temple at Ajunta (circa 200 B.C.), is, according to Fergusson, "one of the most perfect, though far from being one of the most splendid, of the 'Chaitya' caves in India. In this instance every detail is cut in the solid rock, and there does not appear to have been a single wooden ornament on any part, so that we now see the cave nearly as it was left when first excavated." Similar work, though on a less elaborate plan, was executed at Petra, a rock-cut city of Arabia Petraea, about half-way between the south end of the Dead Sea and the head of the Gulf of Akabah. The rock-cut edifices in Petra are supposed to date about the second and third centuries of our era.

Of the methods employed from the earliest times in Hindustan for quarrying large masses of granite we are given an insight by the work done (entirely by native workmen) in the erection of an obelisk at Seringapatam in the early years of the present century. The stone quarried for this obelisk was 84 feet in length, but the completed shaft was somewhat shorter, a small piece having been accidentally broken off in handling the rough stone. It was 6 feet square at the base when finished, and was placed upon a plinth of a single block of granite 7 feet square and 9 feet high, in the top of which was formed a socket 6 feet square and 3 inches deep, to receive the base of the obelisk.

Colonel Wilkes says:—"Although I anxiously watched the progress of this interesting work, I as anxiously left it to be exclusively Indian, and the design of the obelisk was the only aid afforded by any European to the native workmen."

Colonel Wilkes gives the following description of one of the methods adopted in the quarrying of granite at the quarries of Seringapatam, and states that it was used in the case of the above-named obelisk:—"The spot being determined, a line is marked along the direction of the intended separation, and a groove about 2 inches wide and deep is cut with chisels, or, if the stratum be thin, holes of the same dimensions, at 1½ or 2 feet intervals, are cut along the line. In either case, all being ready, a workman with a small chisel is placed at each hole or interval, and with small iron mallets the line of men keep beating on the chisels, but not with violence, from left to right or from right to left. This operation, as they say, is sometimes continued for two or three days before the separation is effected."

Sir J. F. Herschell describes another method which is sometimes used at the same quarries, but which "does not produce so clean a fracture as the first beating. . . . The workman having found a portion of the rock sufficiently extensive, and situated near the edge of the part already quarried, lays bare the upper surface, and marks on it a line in the direction of the intended separation, along which a groove is cut with a chisel about a couple of inches in depth. Above this groove a narrow line of fire is then kindled and maintained till the rock below is thoroughly heated, immediately on which a line of men and women, each provided with a pot full of cold water, suddenly sweep off the ashes and pour the water into the heated groove, when the rock at once splits." This brings to mind the method attributed to Hannibal of splitting rocks during his passage of the Alps, and it has been suggested that his use of vinegar instead of water may have been found advantageous as applied to certain kinds of rocks.

(To be continued.)

THE IRON AND STEEL INSTITUTE.

THE autumn meeting of the Iron and Steel Institute of Great Britain will this year be held in Brussels, under the presidency of Mr. E. Windsor Richards. It is just twenty-one years since the members met in Belgium, the autumn meeting of 1873 having been held in Liège. The Brussels meeting will begin on Monday, August 20, and will end on Friday, August 24. It is expected that the meeting will be very numerously attended, about 500 members having already intimated their intention of being present. The arrangements for the meeting are being organised by an influential local reception committee, of which M. Gillon, president of the Society of Engineers of Liège, is chairman, in conjunction with the general secretary of the Institute, Mr. Bennett H. Brough. Upon the arrival of the members in Brussels on August 20 there will be an evening reception by the burgomaster at the Hôtel de Ville, to which ladies are invited. The morning of Tuesday will be devoted to the reading and discussion of papers in the hall of the Bourse, whilst the afternoon will be given up to a visit to the Antwerp International Exhibition. Further papers will be read and discussed on Wednesday morning, and in the afternoon places of interest in the city will be visited. On Thursday the members will leave Brussels by special train to visit the Mariemont collieries and the Couillet Steelworks at Charleroi, returning to Brussels in the evening. The last day of the meeting will be devoted to a visit to the works of the Cockerill Company at Seraing and the Angleur Steelworks at Liège, the members returning to Brussels in the evening. It is expected that there will be a reception of the members by the King of the Belgians; this, however, has not been definitely settled. There will be no lack of papers for reading and discussion, there being no fewer than ten set down in the list. Of these the first will be "On the Use of Caustic Lime in the Blast Furnace," by Sir Lowthian Bell, who was the president of the Iron and Steel Institute upon the occasion of the Liège visit. The history of crucible steel will be treated by Mr. R. A. Hadfield, whilst papers on other branches of metallurgy and metallurgical chemistry will be contributed by Messrs. T. W. Hogg, H. C. Jenkins, W. G. McMillan, John Parry and D. Selby-Bigge respectively. Two

papers of leading local interest will be contributed by Belgian engineers, namely, "On the Coal Mining Industry of Belgium," by M. Briart, president of the Society of Engineers of Hainaut, and "On the Iron and Steel Industries of Belgium," by M. A. Gillon, president of the Society of Engineers of Liège. A melancholy interest attaches to a paper which is down on the list, "On the Manufacture of Coke," by reason of its author, M. R. de Solderhoff, having died suddenly while reading a paper "On the Progress of Coking" at the meeting of the South Wales Institute of Engineers at Cardiff.

STREET IMPROVEMENTS IN LEEDS.

THE Leeds Corporation are about to carry out extensive street alterations. Some of the more important thoroughfares in the centre of the city, says the *Leeds Mercury*, such as North Street, Vicar Lane and Meadow Lane, are to be widened, and thereby adapted to the traffic requirements. Every citizen is conscious of the necessity for these improvements. Thoroughfares that sufficed twenty years ago are now much too narrow. When Boar Lane, some seven-and-twenty years ago, was made 25 yards wide, it was no doubt thought that it would accommodate the traffic for at least half a century, whereas it has been inconveniently crowded for a number of years. Briggate has been the same. The fact of the matter is that 25 yards is not sufficient for two lines of tramways, much other vehicular traffic, and tolerable footways. Such a width in the heart of the city is not equal to present requirements, to say nothing of the future; and, judging by its growth, which no depression of trade seems to check, Leeds is going to be a very much bigger place than it is now. With enterprises in hand like those referred to, it is important that this continuous expansion, and all that it means so far as street traffic is concerned, should be borne in mind. It would be a huge mistake to provide only for the present. Where property has to be acquired for the purpose, as in the case of the streets to be widened, there is, as a rule, very little difference between the cost of making a thoroughfare 20 yards and that of making it 25 yards wide. In both cases the front buildings must be acquired, and these are the most costly. From every point of view, the advantage to be derived from the additional width far transcends the extra cost.

These considerations ought especially to be allowed to weigh in dealing with Vicar Lane and North Street. When

the widening of these streets was first talked of it was thought that if they were made of a uniform width of 14 yards the requirements would be met. It is now felt that nothing less than 20 yards will suffice, and that, we believe, is the width sketched upon the plans. If it be practicable, such important thoroughfares as these ought not to be less than 25 yards wide, and the widening ought to commence at Duncan Street, at the junction with Briggate, and be continued along New Market Street, Vicar Lane and North Street. The plea may be based on more than one ground. Those who have given consideration to the extension and general improvement of our tramway system are agreed as to the desirableness of the cars from Meanwood, Chapelton and Roundhay coming into the city by one route and leaving it by another. This is requisite for the relief of the vehicular traffic in Briggate, which has at present to serve both for the incoming and outgoing cars, and which, as has been said, is too crowded. The greatest care is required by the drivers of the tram-cars, buses and other conveyances in going along that thoroughfare to avoid collisions. Frequently there is not more than 3 or 4 inches between the passing vehicles, whilst with a line of cabs down the centre and an almost continuous stream of vehicles on each side of it, people wishing to cross have to keep a very sharp look-out. Some day the enterprise of the city may be equal to the widening of Briggate; but that is not contemplated now, and it is necessary that the best should be made of present circumstances. It is clear that considerable relief would be afforded by providing a loop-line for the cars coming into the city from the suburbs named, and by reserving Briggate for them on the return journey. Vicar Lane, New Market Street and Duncan Street can be utilised for the purpose; but in order to make satisfactory provision the width of these streets should not be less than 25 yards. And such a width is desirable also because these thoroughfares form two of the principal approaches to the markets and must accommodate much other traffic. The same remark applies to North Street, where drivers of vehicles have also to be exceedingly careful, and where collisions are too frequently imminent.

These should be regarded as sufficient reasons for making North Street, Vicar Lane, New Market Street and Duncan Street 25 yards wide. But there is another. The greater width would naturally enhance the value of these streets for business purposes, to which they will almost exclusively be devoted. The owner of property in them would gain, and so too would the city, for the one would be able to command a

higher rent, and the other an increased rateable value. The contiguity of the market as well as the tramway traffic would insure their being much frequented. Then need it be asserted that the appearance of the centre of the city would be greatly improved by making these main arteries wide? When a large amount of money is to be spent on such work, that should surely be kept in view. All these advantages are to be gained by pursuing an enlightened and spirited policy. What is to be achieved by adopting a plan less commensurate with present, not to say future, requirements? We should save the cost of taking a few additional yards of land backwards from the street, or rather we should have this land to sell after the widening was carried out. The sale of surplus lands in Leeds, following improvements by the Corporation, has not in all cases proved a very lucrative business for the vendors. It is true that the land would comprise the frontage, and in such thoroughfares it should fetch a good price. But in the other case there would, in most instances, still be a frontage to dispose of, and the street being five yards wider, and therefore affording greater advantages for business purposes, the rate obtained per yard should be proportionately higher. Looked at from whatever point of view the gain to the city, from what would soon be generally regarded as the more prudent policy, would far outweigh what would be saved by the other course. As to the feasibility of the larger scheme, it is understood that it could without serious difficulty be carried out. The notices to treat have been or are about to be served by the Corporation upon the owners of the property required, and there is yet ample time to consider this important question. In the interests of health, of commerce, and of the general prosperity of the city, it is essential that the main arteries should not be of less width than that we suggest.

BUILDERS' BENEVOLENT INSTITUTION.

THE forty-seventh annual meeting of this Institution took place on Thursday, July 26, at the offices, 35 Southampton Row, Bloomsbury. Mr. George Plucknett, J.P. (hon. treasurer) occupied the chair, supported by Messrs. Thomas Stirling, C. Russell, Robt. Perkins, and other friends of the charity.

Major Brutton (the secretary) read the annual report, which states that the committee consider the Institution is progressing, but they do not withhold the fact that it needs increased income, so as to provide for all those who, from

unavoidable causes, are of necessity obliged to seek its benefits. Thus, from want of sufficient income the committee are unable to recommend for election all who apply and are eligible, this being the more to be regretted as most of them are of an age which pleads for immediate relief. There are doubtless many builders in the Metropolis and its environs who are in easy circumstances, but who have never contributed to the funds of the charity; nevertheless, the committee hope such persons may be induced to subscribe, as contributions from them would secure provision for all fit applicants. There are now fifteen men and thirty-three women depending upon the Institution. The preponderance in the number of females is in consequence of the widows of pensioners having been made pensioners on the decease of their husbands, in accordance with the rules. During the past year five male and two female pensioners have died; one male and three female pensioners have been elected. The late Mr. Thomas Robinson, formerly a partner in the firm of Messrs. William Cubitt & Co., has bequeathed 1,000*l.* to the Institution, which, according to the rules affecting legacies, will be invested in consols, and added to the other funded property belonging to the charity. The committee also express their thanks to Mr. George Haward Trollope for the successful exertions he made in his presidential year to obtain a substantial sum for the Institution, this object having been accomplished by Mr. Trollope's influence and liberality. The committee had the gratification to intimate that Mr. Basil Pym Ellis, of the firm of Messrs. Lucas & Aird, had consented to be the President for the ensuing year, and that he would preside at the annual dinner to be held on November 18 next, in the hall of the Worshipful Company of Carpenters, London Wall.

Mr. Thomas Stirling moved the adoption of the report and balance-sheet.

Mr. Robert Perkins seconded the motion, which was agreed to unanimously.

The thanks of the meeting were given to Mr. G. H. Trollope for his support and services during the past year, and votes of thanks were also passed to the vice-presidents and trustees, and to Mr. Plucknett for his valuable services, he being again elected treasurer.

A vote of thanks was passed to the committee, and the retiring members re-elected, with the addition of Mr. Trollope. Thanks were also voted to the auditors, who were reappointed.

On the motion of Mr. Stirling, Mr. Basil Pym Ellis was appointed president for the ensuing year, and a vote of thanks to the Chairman closed the proceedings.

MASTER BUILDERS OF GREAT BRITAIN.

THE National Association of Master Builders of Great Britain held its thirty-third half-yearly meeting in the Mayor's dining-room, Town Hall, Bolton, County Alderman John Bowen, J.P., Birmingham, president, in the chair, and representatives present from London, Liverpool, Birmingham, Manchester, Huddersfield, Northampton, Derby, Leicester, Bradford, Leeds, Bristol, Hull, Preston, Bolton, Wigan, Burslem, Hanley, Tunstall, Longton, Walsall and Southport.

The Mayor of Bolton, Alderman Nicholson, who was received with loud applause, delivered a short address to the representatives, expressing the pleasure it afforded him by being present at such an enthusiastic gathering; he also commented upon the splendid work executed by builders, of which their Town Hall, admired by everyone, was a specimen, and congratulated the Association upon having such a representative meeting.

The Mayor having retired, Mr. Bowen resumed the chair.

The Council reported having issued to the members the customary tabulated statements of hours worked, state of trade and supply of labour in the principal towns in the United Kingdom.

The report for the past half-year was read and discussed, and ordered to be printed and circulated.

The treasurer, Mr. C. W. Green, Liverpool, in submitting his statement of accounts for the past half-year, congratulated the Association upon its sound financial condition.

Mr. Stanley G. Bird, London, stated that the case of *Temperton v. Russell* and the Trades' Unions of Hull, which was entered for the House of Lords, was practically at an end; the deposit to cover costs on the part of the Trades Unions had not been forthcoming, consequently the further hearing of the case had been disallowed.

With regard to the London Streets and Buildings Bill, it had now been referred to the select committee of the House of Commons, but in a very different form to that originally introduced; in fact, there had been altogether ninety-two amendments, of which eighty had been accepted.

The Council reported that the form of contract now under consideration had not yet come to a satisfactory issue, but it is hoped that the Royal Institute of British Architects and the Institute of Builders, who have the matter in their hands, will do their utmost to bring the matter to a close as speedily as possible.

Mr. Robert Neill, jun., Manchester, also gave some valuable information on this subject.

Alderman Jessop, Huddersfield, gave a short description of the dispute with the masons, and expressed his opinion that the rule, now in force in many places, prohibiting worked stone being brought into the town, acts very prejudicially to all parties concerned, and expressed a hope that the members would do all in their power to get such an objectionable rule as this expunged.

Several other matters of special interest to the building trade were brought forward and discussed, and it was decided to hold the next meeting at Birmingham.

A hearty vote of thanks was accorded to the Mayor for his courtesy and kindness in granting the use of the room in the Town Hall for the meeting of the Association.

A vote of thanks was also accorded to County Alderman J. Bowen for his services as chairman.

During the afternoon several of the representatives were conducted over a spinning mill, and in the evening entertained at dinner by the Bolton Master Builders' Association.

DEATH OF A CONTRACTOR.

THE *Staffordshire Advertiser* records the death of Colonel Field, which took place recently at his residence at Shelton Priory, Shrewsbury. The deceased gentleman was a son of Mr. William Field, and was born in 1812 at Pipe Ridware, in the neighbourhood of Rugeley. He was brought up to the medical profession and practised at Rugeley, and was house-surgeon at the North Stafford Infirmary for several years. In the course of his attendance upon the men constructing the Trent Valley Railway he was brought into contact with the late Thomas Brassey, the famous railway contractor, and subsequently became his brother-in-law (Mr. Brassey and Mr. Field marrying two sisters), and was largely engaged with him in the construction of most important works. Mr. Field went to reside in Shrewsbury in 1851, subsequently taking up his abode in the house now occupied by the Bishop of Shrewsbury, and at once became connected with the railway enterprise of the neighbourhood, and was associated with Mr. Brassey in the construction of the Shrewsbury and Hereford, Shrewsbury and Crewe, Severn Valley, Wellington and Market Drayton, Leominster and Kington, Craven Arms and Knighton, Tenbury and Bewdley, and Wenlock and Craven Arms railways, besides

others in the North Stafford district. He was one of the promoters of, and the contractor for, the Stafford and Uttoxeter railway, now amalgamated with the Great Northern system. It was at the large railway works at Coleham, in connection with the Shrewsbury and Hereford Railway, that the 1st Shropshire Artillery Volunteers was first formed, in which Mr. Field took the greatest interest, and of which he was colonel for many years, and upon which he spent large sums of money.

BRICK PAVEMENTS.

A PAPER on "Country Roads," which was prepared for the Engineers' Club, Cincinnati, by Mr. M. D. Burke, C.E., has been brought out in pamphlet form by Messrs. Robert Clarke & Co. The author, before recommending the adoption of brick pavements in Avondale, obtained samples of the various paving bricks manufactured in the United States, and submitted them, as well as other materials, to severe tests. The results he obtained are remarkable, and are worth the attention of municipal engineers and road surveyors in this country. The following extract on pavements in general will suggest the author's method of treating his subject:—

The office of a street pavement is to provide a wearing surface, which shall fulfil the following conditions:—

1. It must present a secure and pleasant footing for animals.
2. It must have sufficient smoothness to render travelling in carriages agreeable, and traction easy and as nearly noiseless as is practicable, for all descriptions of wheeled vehicles (excepting those provided with flanged wheels).
3. It must be of such form and material that liquids falling upon it will quickly flow from it into proper conduits, and must furnish no permanent lodgment for street filth of any kind.
4. It must be capable of sustaining without change of form any and all loads usually transported on public highways.
5. It must be reasonably durable, both as against the attrition of street traffic, and the destroying or dissolving action of the elements.
6. It must be economical; that is to say, sufficient comfortable use must be obtained from it to make it worth both the cost of construction and maintenance.
7. It must be capable of removal and replacement, or repair from failure at reasonable cost, and with materials

and appliances within the control of the street repairing department.

A study of these conditions at once reveals the reason why the "paving problem" is of such an intricate nature that it has so long remained unsolved, as well as a cause for so many unhappy failures in its attempted solution.

For the first and second conditions, the dirt road in good repair stands without a rival, but it meets no other requirement, hence its use is restricted to race tracks and country roads, which, like canals, are only navigable when the weather conditions are favourable.

For the second, third, and fourth conditions, the asphalt pavement on proper foundation appears to be better fitted than any other that has come into such general use; but many persons say that it does not properly meet the first requirement, criticise it severely as to the fifth and sixth, and affirm that it utterly fails to meet the seventh.

Stone block pavements meet the first requirement, but indifferently; utterly fail in the second and third, when properly constructed; are better adapted to comply with the conditions of the fourth, fifth, and seventh than almost any other description of city street, but when a high charge for transportation is to be added to the cost of preparing the material they fail to meet the sixth condition.

Wooden block pavements meet the first, second, fourth and seventh conditions fairly well, when made of suitable materials well combined; but, as they have been built in this country, have signally failed to meet the third condition, and have fulfilled the fifth and sixth but very indifferently.

The boulder or cobble-stone pavement has been with us so long, and has been treated so badly, that familiarity with it has bred a species of contempt that is hard to overcome. It has become popular to consider it an all-round failure, yet it meets the first and seventh conditions fairly well, and so far as the material is concerned, it stands unrivalled in the fifth. In many of our cities where horse cars have been operated for the past twenty or thirty years, and the street railway companies are required to maintain the pavements within their tracks, the boulder pavements are still retained between the rails, while the residue of the streets have been paved with other materials, because in that position they are said to meet all of the conditions named, excepting possibly the second and third, better than any other substance yet offered for the wearing surface of roadways. This saying, however, does not appear to be anything more than an expression of opinion, which

cannot be sustained by any process of reasoning. The cobblestone can be given no definite bearing on any foundation; it cannot be held in position by any bond that can be given in construction. It does not present a suitable surface for vehicular travel, or that can by any process be kept free from filth; yet it does not wear out, is easily restored if loosened from its place, and it does answer very well for street car horses to travel upon.

Broken stone or macadam as commonly used, of mingled limestone and shale, meets none of the requirements. If, however, it is clean refractory material, properly prepared and combined by rolling, it fulfils all the conditions except the third (and even that reasonably well), providing the traffic is moderate, and the repairing is promptly and efficiently done. It may be set down as an established fact, however, that when a macadamised street is dug into for any purpose that it is never properly replaced.

No one of these conditions can be entirely ignored, yet it is obvious that no pavement yet devised fully meets all of them. Could the first be ignored, it would be an easy matter to cover street surfaces with iron or steel plates that would fully meet all the others, but plainly this cannot be done. The surroundings of the pavement and the extent and nature of the traffic to which it is to be subjected, must be considered in order to decide which of the conditions shall be allowed to determine its character. The first, that of furnishing a secure and reasonably comfortable footing for animals, can in no case be ignored, and in many instances must control all other considerations. Wherever the pavement is to be used as a thoroughfare for vehicular traffic at fair rates of speed, or when time, pleasure driving, or quietness become elements of importance, then the first and second conditions must be met, and other features may or may not be caused to yield to their requirements. But the preservation of life and health is the essential cause of business activity, hence the third condition, that of maintaining correct sanitary conditions, should never be neglected.

To those at all familiar with street construction it is obvious that the wearing surface, or pavement proper, cannot, and does not in itself, support the loads brought upon it, but that it more or less successfully resists the impact and abrasion incident to the traffic, and transmits the weight directly to the bed or foundation upon which this surface material has been placed. It follows therefore that the fourth condition can be met by any description of paving material which has sufficient hard-

ness to retain its form under the pressure of street traffic by merely placing it on a properly-prepared foundation; and further, that, unless the pavement shall be placed upon a bed capable of sustaining under all conditions the loads brought upon it, the surface will yield regardless of the material of which it is composed, and that this condition not being complied with, no essential feature of a good street surface will remain. Failure to meet this condition is the error most commonly committed in the building of pavements. In this latitude the winter frosts penetrate to a depth of from 1 foot to 3 feet, or, when not acted upon by frost, the subsoil drainage is seldom so thoroughly efficient as to prevent the changing of the ground from a firm unyielding soil to one of almost complete saturation, thus materially affecting its sustaining power. It therefore follows that no pavement which is to be subjected to a heavy traffic at all seasons of the year can be relied upon to retain the form originally given it, unless the foundation or bed upon which it is placed shall either be carried below the action of the frost, say 3 feet or more, or be so constructed as to distribute the weights of passing loads over sufficient areas to enable a comparatively weak subsoil to sustain them. The deep foundation is the ancient, and undoubtedly the most durable method, having apparently been the ordinary practice with the Romans, but the distributing coating is far more economical, and hence has become the established modern practice.

Two methods are in vogue. First, to drain the sub-roadway as efficiently as is practicable, grade it to the proper form, compact its surface by rolling, and cover it with a layer of mingled broken stone and gravel, which is made smooth and firm by flooding and rolling with a steam roller, the layer of metal being from 6 to 12 inches in thickness, according to the requirements of the locality or the specifications. On this layer or "foundation" is spread the bed of sand in or upon which the pavement is set. Sometimes broken stone alone, and again gravel only, is used for the bottom course. This style of "foundation" is used very extensively for all descriptions of pavements excepting asphalt. With brick pavements the practice of placing a layer of bricks flatwise on the bed of sand, covering them with a thin coating of sand and paving on it the wearing surface on edge is quite common, and produces what is called the "two course" pavement. Still another method consists in covering the layer of sand with tarred boards, upon which the sand cushion and brick on edge are paved herring-bone style, producing the

"Hale Pavement." In this, however, the broken stone is generally omitted, the boards being separated from the subsoil by from 4 inches to 6 inches of sand only. These expedients tend to better the distribution of the weights brought upon the pavement, and have the merit of economy in first cost, but they are obviously inadequate except where the subsoil is exceptionally good and the traffic very moderate. The method of combination is quite defective. When gravel is used that is free from loam it will not compact under the roller, and if it does contain loam the water which comes from the subsoil and percolates through it is liable to carry the soluble substances with it down the gradients, and leave the pavement unevenly supported. When broken stone and gravel, or broken stone alone, forms the foundation course, it is expected to be porous and act to some extent as a subsoil drain. The voids, however, are liable to become the receptacles of the clay from beneath which is brought up, or rather the stones brought down by the pressure upon the pavement, or they will be filled by the sifting down of the bedding course of sand caused by the jar of the travel, and this escape of the sand will leave the blocks unevenly supported. All of the varieties described in this first method are extensively used, and are made more or less expensive and durable, or cheap and temporary, as they are carried to greater or less depths, and as the work is thoroughly or carelessly done. But they are so constructed that natural causes would alone destroy them in a comparatively brief space of time, and when the forces of nature are aided by the disturbances to which the sub-grade of the street is ordinarily subjected and the traffic upon the pavement, it follows that the life of such a foundation seldom exceeds the duration of the wearing surface, and the failure of the former very frequently accelerates the destruction of the latter.

The second method consists in preparing the subsoil by grading and rolling as before described, and placing upon it a layer of hydraulic cement concrete to serve as a foundation for the pavement. For equal volumes the cost of the concrete is about three times that of the broken stone or gravel; but from one-half to two-thirds of the amount is required, hence the expense of the concrete foundation is one and a half to twice that of the broken stone or gravel. When properly made and undisturbed, it will not yield to the action of the weather, and the renewal of the pavement need extend to the wearing surface only. The expense of cutting through and replacing the concrete when the street must be opened for any purpose is much greater (perhaps two to three times) than in the other

forms of foundation, but such work can be done without serious injury to the remainder of the street; and when repairs are properly made the opening of the pavement and its foundation is less injurious to the street having a concrete foundation than the one that has it not, because the concrete base will support the pavement over small cavities, while the broken stone or gravel will sink into them.

The thickness of the concrete varies with the requirements of the traffic and other conditions, from 4 to 8 or more inches. The ordinary practice is to use natural cement in its composition, and make the coating 6 inches in thickness for roadways of medium traffic without car tracks. The condition of the subsoil should, however, be considered in determining the depth of concrete, for where it is soft or spongy or trenches are to be spanned, a greater amount will be required. A concrete foundation is an absolutely necessary beginning for any really good and durable street pavement, and even for work of medium character and price it is economical. Pavements of sheet asphalt are always placed on concrete foundations, the wearing surface being separated from the cement by a cushion coat, ordinarily about half an inch in thickness.

Stone, asphalt, wooden block, or brick pavements are usually placed on a layer of sand from 1 to 2 inches in thickness over the concrete, but the practice regarding the cushion coat is by no means uniform, varying from an actual bedding of the blocks in the cement mortar to 2 or even 3 inches of sand; but the general custom in this country appears to be in favour of the sand cushion, convenience in construction and repairs, and the theoretical elasticity of surface being in favour of that combination. The choice of the sand to be used is of more than ordinary importance, since if it contains a considerable percentage of soluble substances, or is alternately coarse and fine in different places, displacement is likely to occur, and the pavement will become uneven.

All block pavements, whether of stone, wood, asphalt, or brick, should be as closely placed as is practicable, and the interstices filled with a non-absorbent material. Possibly a narrow spacing may be required on gradients paved with sawed wooden blocks to furnish footing for animals, but the wide spacing ostensibly for this purpose so frequently seen in all these varieties of pavements is undoubtedly bad practice, since it so materially reduces the resistance of the material composing the wearing surface, facilitates the chipping from the angles, and produces an uneven, noisy street, with cavities to receive and retain filth.

TEQUIQUIAC TUNNEL, MEXICO.*

THE problem of the drainage of the valley of Mexico has occupied the attention of the inhabitants from the time of its conquest until now. The present project was begun by the Emperor Maximilian, but with the fall of the empire there was a complete stoppage of all works until 1885, when a special drainage board was established. Arrangements for a loan were made in 1888 and the work taken in hand by the present contractors. At that date 1,639 yards of the tunnel had been completed and four shafts were down to the tunnel level, with others partially completed. The quantity of water to be dealt with was under-estimated; at one time it reached 1,000 gallons per minute and the expense was very great.

The small size of the shafts, the shape of the tunnel and the character of the ground were all obstacles to the prosecution of the work. There were twenty-four shafts spaced about one-fourth mile apart, with an average depth of 175 feet, the deepest being 300 feet and the shallowest 65 feet.

The city, as is well known, is in a basin surrounded by mountains, so that there is practically no exit for the water, and it is all drained into Lake Texcoco. The object of the works is twofold—to control the level of the water in the lakes and in the valley, to get rid of any injurious surplus, and to form an outlet to storm waters and sewage. The works consisted of a canal 35 kilometres (21·74 miles) long and a tunnel to kilometres (6·21 miles) long.

The first effort made was to connect the various shafts as quickly as possible, so as to afford an outlet for the waters through the open end of the tunnel. While this was being done, no work, as a rule, was attempted in the same run of ground, as it was found to delay more or less the progress of the heading. As soon as two shafts were connected, tunnelling could be done between them, care being taken not to block the water. To make the greatest progress with the work, it was necessary to obtain as many working faces as possible; hence, at some convenient spot at the heading between the shafts, break-ups were made through the heading, and a length of tunnel opened by which means two more faces were obtained to work from. The number of these depended upon circumstances; usually two, or sometimes three, break-ups

were made between two shafts. Two were found to give the most convenient working. By this means the progress of the tunnel was very rapidly increased, as each face would average 60 to 90 feet per month.

The tunnel section was flattened at top and bottom, the chord of the arc being approximately the same length as the height. The flow was estimated to rise to the spring of the arch, giving a depth of water of 9 feet, with a calculated velocity of $4\frac{1}{2}$ feet per second and a discharge of 200,000 gallons per minute, the grade being 1 foot in 1,380 feet.

The arch consists of four concentric rings of bricks. The invert and side walls are constructed of artificial blocks, with a backing of volcanic stone rubble masonry. The thickness of the side walls, including backing, is 18 inches, and the invert has a thickness of 1 foot. The blocks are made of one part Portland cement and three of sand.

The ground through which the tunnel is driven is of very unusual character. There is no regularity in the strata, and nothing to indicate what will be found at any particular point in the line. The formation is for the whole distance of volcanic origin. One of the rocks found in large quantities is tepetate. Sometimes this is very hard. The greater part of the ground was of soft compact material, which on exposure to the air crumbled and swelled, thus throwing great weight on the timber. The remainder consisted of sand, both compact and running, and boulders. Water was always met with in large quantities in the tepetate and sand formations, while the soapstone formations were usually dry. Potholes were frequently struck, from which water would flow out with great force, bringing much sand, mud and stone, sometimes drowning out a pit and even tearing out the track and twisting up the rails.

The local workmen were unable at first to attend to the timbering without being closely watched by English miners both night and day. After a time they learned the general method, but constant watchfulness was necessary in all heavy lengths. They have improved wonderfully, however, and are now remarkably quick and handy. The best progress was made by working double lengths. This system required that a bottom heading should have been previously driven. The system of double lengths has been very successful; as much as eight lengths in one face, or 120 feet of complete tunnel, have been constructed per month. It requires extra care in timbering. The bottom headings were $6\frac{1}{2}$ feet high, 4 feet wide at the top in the clear and 6 feet at the bottom in the clear. As a rule the bottom heading was 2 feet above the invert of the

P. A. GILBERT WOOD, 175 STRAND, LONDON, W.C.

tunnel, to make room for the drainage. A drain 2 feet deep was cut in the bottom. The average daily progress in the bottom heading was $5\frac{1}{2}$ metres. The heading was usually built to one side of the centre to make room for the tunnel traffic when the tunnel was being constructed at the same point. By paying close attention to details, increasing the pay for work in the heading, the introduction of eight-hour shifts, &c., the progress of the work was very greatly increased.

The care of the water was one of the greatest difficulties met with. The total discharge of water at the tunnel mouth varied from 1,500 to 3,000 gallons per minute. At first two 12-inch pipes were sufficient to carry water, but later on when the pumping was increased, these had to be largely supplemented and a large launder used, which seriously interfered with the small space available for the masons. The making of dams where the ground was soft was very difficult. Finally a hollow board dam made to fit the shape of the invert proved very successful. This could be put in position quickly and weighted down with clay placed inside, and was tight and effective. Ventilation and the handling of material for construction were carefully attended to. The cost of the tunnel finished during the past year has averaged from 650 dols. to 700 dols. per metre. During the year ending September 15, 1893, there were 4,421 metres of heading driven and 2,037 metres of tunnel built, leaving 900 metres of heading to be driven and 2,667 metres of tunnel to build to complete the work. The greatest advance in any one month was 200 metres of heading and $55\frac{1}{2}$ metres of tunnel advance on any one face.

CAST-IRON BRICKS.

"WHILE I was in Germany last year," says W. L. Burgess, of New Haven, writing to the *St. Louis Globe Democrat*, "I came across several walls surrounding some of the public institutions that were constructed out of cast-iron bricks. These bricks certainly have many advantages over the old-fashioned clay bricks, though they may not prove to be superior in all respects. In form and size these bricks resemble our ordinary bricks, but they are composed of cast-iron, and hollow. The shell is so thin that the brick weighs less than one made of clay. A wall is built of such material without the use of mortar, and no skilled labour is required in laying them. The upper and lower sides of the bricks are provided with grooves and projecting ribs, which fit into each other easily and perfectly,

and form a wall of great strength. There are also two large circular openings in the upper side of each brick, arranged so as to receive projections on the lower side of the brick that is to be placed above it. One of the projections is hook-shaped, which secures a solid hold. A wall of these bricks is put together very quickly. After the wall is built it is covered with paint. This closes all the cracks, rendering the wall air-tight, and prevents the bricks from rusting. The bricks are very durable, and a building constructed of them would be practically fireproof."

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

13656. John Bousfield, for "Improved wrought-iron or steel roller frame for tops of sliding doors."
 13701. Thomas Peard, for "Improvement in spring centres for swing doors."
 13715. Ernest George Combe, for "Improved fastening to be applied to cellar-flaps, pavement-lights, coal-cellar gratings and the like."
 13782. Sidney Jennings and John Morely, for "Improvements in water-closets and in apparatus suitable for flushing the same."
 13810. Edmund George Kendall, for "Improved reversible window-sashes and frames."
 13860. David Dowson, for "Improvements in sash-fasteners."
 13888. Peter Ellis, for "Improvements in couplings for pipes."
 13889. Charles Lea, for "Locks."
 13950. Henry Swann, for "Sash stop and window-fastener or mortise-lock."
 13991. William Gibbin, jun., for "Improvements in and relating to window-sashes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

ESTABLISHED 1790.

THE "WASH-OUT" CLOSET

(PATENT).

THREE AWARDS AT THE INTERNATIONAL MEDICAL SANITARY EXHIBITION,
SOUTH KENSINGTON, 1881.

No. 234.

WASH-OUT.

"How to Drain a House," from a paper by T. MELLARD READE, Esq., C.E., F.R.I.B.A., read before the Liverpool Architectural Society:—"I consider the pan-closet objectionable, especially since the introduction of the two-gallon regulating cistern has increased the difficulty of getting the after-flush to fill the pan. The 'container' is usually a reservoir coated with filth, hidden by the pan holding the water in the basin. A basin with a trap at the side or back, called a 'WASH-OUT' basin, is a far better apparatus."

"Improvement on Sanitary Condition of Houses," from a paper by J. CORBETT, Esq., read before the Social Science Congress, Manchester, 1879:—"We replace defective Closet Appliances by the simple 'WASH-OUT CLOSET,' which is of white earthenware, without any valve, and so perfectly self-cleansing as to require very little attention."

Extract from a letter by "M. O. H.," a Medical Officer of Health, *Daily Telegraph*, September 22, 1880:—"The Local Government Board forbids the use of these pan-closets. . . . They may be easily replaced by one of the 'WASH-OUT' CLOSET Basins."

Extract from a lecture by W. EASSIE, Esq., C.E., at the International Health Exhibition, May 28, 1884:—"A cleanly 'WASH-OUT' Flushing Rim Basin in connection with a small Flushing Tank overhead which merely required a touch of the depending chain and ring to liberate the whole contents."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

HANWELL.—Aug. 18.—For Painting School. Mr. A. G. Langdon, 17 Craven Street, London, W.C.

ISLINGTON.—Aug. 13.—For Erection of Boundary Walls at Disinfecting Station. Mr. J. Patten Barber, Vestry Hall, Upper Street.

KILLMARSH.—Aug. 13.—For Building Twenty-one Cottages. Mr. John Allsopp, Architect, Worksop.

LISBURN.—Sept. 6.—For Construction of Extensive Works for the Water Supply. Mr. John Lanyon, Engineer, Northern Bank Chambers, Belfast. Mr. Richard Young, Lisburn, Town Clerk.

LITTLE LEVER.—Aug. 23.—For Sewage Works. Messrs. Lomax & Lomax, 11 Fold Street, Bolton.

LIVERPOOL.—Aug. 13.—For Making Roads. Mr. F. C. Everett, Public Offices, Green Lane, Tuebrook, Liverpool.

LONDON.—For Road and Sewer Works, Springfield Estate, Herne Hill. Mr. Charles Barry, Surveyor, 1 Victoria Street, Westminster.

LOSTWITHIEL, CORNWALL.—Aug. 13.—For Provision of about 195 Tons of 4-inch and 3-inch Cast-iron Pipes, including Laying and Jointing same in a Supply Main about Three Miles in Length, and the Distributing Mains in the Town, together with the necessary Valves, Hydrants, &c., and Construction of a Concrete Supply Tank to hold 41,000 Gallons, the Sinking of a Well, and the Provision of By-pass and Overflow Pipes, and other Works at the Source. Messrs. Jenkin & Son, Liskeard, Cornwall.

LUDLOW.—Aug. 29.—For Constructing Stoneware Pipe, Sewers, &c. Mr. W. Wyatt, Pride Hill Chambers, Shrewsbury.

MANCHESTER.—Aug. 18.—For Supply of Pumping Engines for Hydraulic Power Supply. The Town Clerk.

MERTHYR TYDFIL.—Aug. 15.—For Building Baptist Chapel and School. Messrs. Morgan & Son, Architects, Carmarthen.

MITCHELSTOWN.—Aug. 23.—For Building Dwelling-house, Out-buildings, &c. Mr. R. Fitzgibbon, Clerk to the Guardians, Mitchelstown.

MONK BRETTON.—Aug. 11.—For Additions to National School. Messrs. Wade & Turner, Architects, 10 Pitt Street, Barnsley.

NEW BARNET.—Aug. 14.—For Supplying Road Material. Mr. G. W. Brumell, Local Board Offices, Barnet.

NEWCASTLE-ON-TYNE.—Aug. 15.—For Lighting and Heating Church. Messrs. Marshall & Dick, Architects, 4 Northumberland Street, Newcastle-on-Tyne.

NEWTON TOWNE.—Aug. 17.—For Additions and Alterations to School. Messrs. J. Harding & Son, Architects, 51 Canal, Salisbury.

OTTERY ST. MARY.—Aug. 16.—For Rebuilding Tipton Bridge. Mr. H. Michelmores, County Council Offices, Exeter.

OVER WALLOP.—Aug. 18.—For Building School and Master's House. Messrs. J. Harding & Son, Architects, 51 Canal, Salisbury.

POOLE.—Aug. 29.—For Constructing Stoneware Pipe Sewers. Borough Engineer, Poole.

POWBURN.—Aug. 11.—For Additions to Plough Inn. Mr. George Reavell, jun., Architect, Alnwick.

PRESTWICH.—Aug. 10.—For Building Two Blocks at Asylum. Messrs. H. Littler & Son, Architects, 4 Chapel Walks, Manchester.

RAMSBOTTOM.—Aug. 13.—For Conversion of Premises into Public Offices, Board Room, &c. Mr. Arthur W. Smith, Surveyor, Callender Street, Ramsbottom.

ROCHDALE.—Aug. 15.—For Paving, &c. Mr. S. S. Platt, Town Hall, Rochdale.

SLOUGH.—Aug. 16.—For Supply of about 325 Tons of 12-inch Cast-iron Pipes, Bends, &c., delivered free to the Slough Goods Station on the Great Western Railway, or to the Stoke Road Wharf of the Grand Junction Canal. Mr. John Baker, A.M.I.C.E., Mackenzie Street, Slough.

SLOUGH.—Aug. 16.—For Supplying and Laying about 1,260 Yards Run of 18-inch Stoneware Pipe Sewer and about 880 Yards Run of 15-inch Ditto at Various Depths, and Construction of Manholes, Flushing Chambers, &c., in Connection therewith. Mr. John Baker, Engineer, Mackenzie Street, Slough.

SWINDON.—Aug. 13.—For Alterations and Additions to Lower Swindon School. Mr. W. Drew, Architect, Swindon.

TREHARRIS.—Aug. 17.—For Additions to Board School. Mr. John Williams, Architect, Morgantown, Merthyr Tydfil.

WHITTINGHAM.—Aug. 26.—For Painting the Asylum, Whittingham, near Preston, Lancs.

WORKSOP.—Aug. 25.—For Sinking Well. Mr. J. Allsopp, Engineer, Worksop.

VARIETIES.

A NEW anatomical building is about to be erected in connection with Queen Margaret College, Glasgow.

A COLLECTION designed to show the development of railway rails, from the early platways to the heavy rails now in use, is in course of arrangement in the machinery and inventions division of the South Kensington Museum.

ELECTRIC light has been introduced in the church of St. Martin on the Hill, Scarborough.

The County Buildings committee of the North Riding County Council reported on Tuesday that if it be found necessary to erect County Buildings on a new site, that numbered 2 on the plan is the most suitable. They had met five architects, and instructed them to prepare sketch plans and estimates of proposed new County Buildings. The plans and estimates had been lately received, and the committee proposed to refer them to Mr. Alfred Waterhouse, R.A.

THE Foresters' High Court meeting at Cambridge have resolved that "the contracting-out clause inserted in the Employers' Liability Bill would be detrimental to the best interests of friendly societies and their work."

THE technical instruction committee of the West Hartlepool Council have adopted the design of Mr. Cheers, of Twickenham, for new Technical Schools, but as objection to the expenditure of 12,000*l.* has been raised, the final decision on the subject has been postponed.

At a meeting of the Blackpool Town Council on Tuesday complaints were made that serious attempts had been made to interfere with the electric light supply and the running of the electric tramway during the busy season. Scientific measures had been taken to run the tramway current to earth, and to otherwise hamper the staff, the interference being of so damaging a nature that a special watch would have to be maintained.

MR. E. G. LOVEGROVE, the surveyor to the Corporation of Richmond, has been appointed the successor to Mr. de Courcy Meade as the surveyor to the Hornsey Local Board.

A DISPUTE between the vestry of St. Martin's-in-the-Fields, London, and the owner of the Lowther Arcade, in respect to the drainage of the arcade, came before a Divisional Court of the Queen's Bench on Tuesday. The judges decided that the obligation to execute the drainage works rested upon the vestry.

THE capital of the Dublin Artisans' Dwellings Company is to be increased by 50,000*l.* in order to erect additional buildings.

1829.

THE badge and chain of office to be presented to Mr. Alderman Marcus Samuels, sheriff-elect, is being made at George Kenning's manufactory, Little Britain, E.C.

THE Turkish Department of Public Works has ordered the immediate repair of the old aqueducts of Solomon in Jerusalem. These aqueducts will bring the water to the city from the fountains of Arroul. A tunnel is to be built 3,750 metres long, and is to cost 80,000*l*.

THE *City Press* says that one of the turrets of St. Giles's, Camberwell, "is decorated with corbels representing the heads of Mr. Gladstone, who is provided with angel's wings; Lord Salisbury, who has a demon's ears and claws; Lord Randolph Churchill, who has acquired dragon's wings; Sir William Harcourt, and what appears to be Mr. Goschen, who is graced with horns, but whether those of the 'Horned Moses' or of a nether spirit is not apparent. This group of political corbels looks very odd as adorning a modern church. Evidently the sculptor had Liberal, not to say Home Rule, proclivities, to judge by his adornment of Mr. Gladstone. It is very strange how the execution of so remarkable a set of heads could have been allowed to adorn a sacred building in the nineteenth century."

ACCORDING to the same correspondent, few if any of Wren's churches in the City have their walls either parallel or four-square. Most likely Wren was obliged to follow, or chose to follow, the lines of the old foundations, and this was of course the case in the rebuilding of churches where much of the old edifice was built into the walls of the new. To take a few instances only, mention may be made of St. Stephen's, Coleman Street, St. Magnus, London Bridge, and Allhallows-the-Great. The first of these is but little troubled with right angles, and the west end is considerably wider than the east. In the case of St. Magnus the variation in width between the east and west ends is stated to be no fewer than 7 feet, and the last-mentioned is terribly askew. St. Margaret, Lothbury, and St. Michael Paternoster Royal also provide striking examples of this peculiarity, which is not altogether, however, a feature adding to their beauty, although it undoubtedly adds to their interest.

THE Westminster Schools, Hoole, near Chester, are being warmed and ventilated throughout by means of Shorland's patent Manchester stoves and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

BUILDING AND BUILDERS.

THE tender of Mr. H. Lovatt, of Wolverhampton, has been accepted for the Technical Instruction Buildings, which are to be erected at Stafford from designs by Messrs. Bailey & M'Connell, of Walsall.

THE Glasgow Building Trades' Exchange in Glasgow will occupy temporary premises at 30 Gordon Street. There are already about 120 subscribers connected with the Exchange, consisting of leading architects, measurers, builders and representatives of the various departments of the building trades in Glasgow and the west of Scotland. The premises include a general room for the use of all members, two sample-rooms, a room for members who wish to transact any private business and a secretary and directors' rooms. A large number of applications have been received for space in the sample-rooms, but no allocation has as yet been made.

CONTRACTORS' RISKS.

EVERYBODY who has had any experience in the sanitary, water or gas works of any of the old cities and towns in England is aware of the existence of drains, conduits and pipes, which were forgotten until they were revealed by the new operations. A case relating to one of these drains came before the Queen's Bench Division on Wednesday. Mr. Kellett, a contractor for drainage works in York, agreed to the conditions by which he was to "protect, support, restore and make good all houses, buildings, sewers, drains or other things which may be disturbed or injured during the execution of the work or in consequence of its construction." He was also to restore the sewers in case of accident in order to prevent the influx of sewage in the new works, and to accept all risks from floods. While driving an heading a old sewer which was unknown to the corporation and the engineers was broached. About the same time an extraordinary flood occurred, which, passing through the new shaft and heading, caused the old sewer to burst, and damage arose to the neighbouring buildings. A part of the river wall was also washed away, and in several of the streets houses were injured. When, as is usual, differences arose in settling accounts, and Mr. Mansergh, C.E., was employed as arbitrator, he came to the conclusion that the damage was not caused by any carelessness or neglect of the contractor or his workmen, or by non-compliance with the conditions. A case was stated at the

desire of the Corporation of York. The judges considered that for the flooding in the vicinity of the old shaft and the consequent damage in the neighbourhood the contractor could not be held liable, but for the damage to river wall and to houses near the new streets their lordships came to a different conclusion. The latter part of the decision will cause some surprise.

LOWEST TENDERS.

At the meeting of the East Preston Board of Guardians on Tuesday a letter was read from Mr. T. P. Hall, of Southsea, whose tender amounting to 302*l.* 7*s.* 6*d.* for drainage works at the workhouse was passed over in favour of one for 305*l.*, as appeared from last week's *Architect*. Mr. Hall asked if the guardians were not in a position to accept his tender, why was he put to the trouble and expense of tendering? He could understand the usual clause with regard to the non-acceptance of the lowest or any tender as a safeguard against firms which the guardians knew could not carry out the work, but this had been wrongly applied in the present instance, for no reason could be given in the case of his firm. He pointed out that he had done work under the Board's surveyor before, and gave a list of well-known architects under whom he had also contracted, and said, considering the circumstances, he thought the Board should pay the expenses of his tender—3*l.* 3*s.*—for which he sent an account. One of the guardians said he did not wonder that Mr. Hall felt aggrieved. He considered the action of the Board ill-advised. The clerk was directed to inform Mr. Hall that his request could not be complied with.

WESLEYAN CHURCH, DUDLEY.

Two richly-coloured memorial windows have just been placed in the above church, one on either side of the organ chamber. The work has been admirably executed by Mr. T. H. Yates, stained-glass artist, of High Street, Smethwick. The subjects chosen for representation are the Crucifixion and Resurrection. In the centre of the former subject the figure of the Saviour appears suspended from the Cross, at the base of which are seen standing Mary and St. John. The figure of the dying Lord, in its general pose and careful treatment is strikingly effective, the facial expression and tension of the muscles being powerfully suggestive of the agony endured in His extremest moments. The other figures are equally successful in treatment, the intense sorrow depicted in the features, together with the dejected

attitude in which they stand, being thoroughly in keeping with the solemn sadness of the scene portrayed. The subdued tone of the background, with the buildings of the city quietly indicated, give additional value to the figures, which have just sufficient colour in the drapery to render the window rich and effective as a whole. In the Resurrection the treatment is naturally more vigorous. Here the risen Lord is represented as just having emerged from the tomb, at the entrance of which He stands, with the victor's banner in hand, Conqueror of death and the grave, while the Divine power and glory are symbolised in the clouding and golden rays by which He is surrounded. At His feet are the Roman soldiers, represented in deference to traditions as being asleep. In this window the colouring throughout is rich and cheerful, the ruby in the Saviour's robe being particularly rich in appearance, and gaining effect by the wise introduction of quieter tones in the dresses of the Roman soldiers. Each window has an ornamental border and base of classical treatment, in keeping with the character of the window, and forming an effective setting to the subjects represented. One window is the gift of Mr. Francis Downing, in memory of his wife, and the other is the gift of Alderman Job Garratt, in memory of his mother. In addition to these two memorial windows, the whole of the windows in the church have also been filled with stained-glass of an ornamental character; and, together with the artistic decoration of the interior, give to the building a very bright and attractive appearance.

THE STANDEDGE TUNNEL.

THE new double-line railway tunnel made through the Standedge Hills from Marsden to Diggle by the London and North-Western Railway Company, and the works connected therewith at each of those places, so far as they are completed, have been inspected by Major Yorke, Government Inspector of Railways, who gave his certificate for the opening of the new tunnel and works. The first sod of the new tunnel was cut on August 5, 1890. The tunnel is 3 miles and 60 yards long. The maximum number of men employed on the works has been 1,800. The work of boring the tunnel was of a stupendous character, the geological formation being millstone grit and Yoredale shale, with coal in a few seams too thin almost throughout to be worth separating. The character of the work may be judged from the fact that 120 tons of gelignite were used in blasting operations. The millstone grit removed was crushed and used for ballast for the permanent way.

NEW WESLEYAN CHAPEL, ARGYLE STREET, HULL.

ELECTRIC POWER, HEATING AND LIGHTING.*

My object is to show you some of the latest developments of electrical science mainly in the field of domestic appliances, with a view of discussing the advantages they may offer to architects seeking to improve the present ordinary methods of motive power, heating, lighting, ventilating, cooking, &c. I should like at the same time to indulge in a few speculations as to how far such developments of electrical apparatus and their possible improvements and extensions might influence the education of the future architect, and as to how he will take advantage of them for improving our houses, and the consequential alteration in his plans and structures of our future buildings.

Let us commence with electrical motive power, and, in considering this subject, it may be useful to explain briefly the theory of electric motors, and for that purpose to refer to the magnetic field. The region through which a magnet exerts its influence is called a magnetic field, and Faraday's conception of lines of force flowing through a field helps us to understand the action of magnets on each other and on currents of electricity. By means of iron filings, I show you a plan or map of the field about a straight magnet; each particle of iron becomes a tiny magnet, and sets itself along the lines of force. Another diagram is produced in which the lines of force are shown crossing the space between the poles of a magnet opposite each other, which is the usual disposition of the poles of the field magnets of dynamos and motors.

I will now refer to the effect produced in a moving conductor when passing through a magnetic field, which is, as you

will presently see, of great importance in a motor. Here I have a copper disc, capable of quick rotation; whilst it is in motion I suddenly produce an intense magnetic field about it, and as you see it is at once brought to rest. This is due to the fact that a conductor cutting lines of force has an electromotive force induced in it which can set up a flow of current, and as currents of electricity are attracted or repelled by magnets according to the direction of their flow, you see the action between the currents generated in this plate and the lines of force due to the magnet is such as to oppose the motion of the plate. Motors such as I am going to speak about are dynamo-electric machines capable of transforming electrical energy applied to them into mechanical energy, and this as a rule at any convenient point. When lines of force belonging to separate magnetic fields are in proximity, so as to permeate a common space, the lines due to these separate fields all tend to place themselves so that as many as possible have the same direction. In the model before you I can produce two such fields, one due to the current flowing through the field magnet, and another to that flowing through the armature. The field magnets being fixed and the armature being free to turn, if the fields are not coincident then the stress set up between them will cause the armature to respond to it, and turn so that the lines due to both fields may coincide in direction; when this occurs the armature would of course stop, but by altering the connections of the armature to the source of current just at this moment, so that coincidence is destroyed, the revolution of the armature is continued. The alteration in the direction of the flow of current so as to produce a lack of coincidence between the two lines is brought about by the commutator in this manner. The winding of the armature ring is continuous, but it is divided into sections, each section being connected to a plate or bar constituting a segment of the commutator. The segments are conveniently placed round the armature axle, insulated from it and each other, and thus disposed they form the commutator. The current is supplied to the armature by two brushes which bear on the commutator at opposite sides, and by placing the brushes in a suitable position the field produced in the armature may be sufficiently out of coincidence with that of the field magnet as to produce rotation in the effort to effect that coincidence. Suppose current is supplied to the armature by way of the brushes, it will divide, half of it going through one-half of the armature in one direction and one-half of it through the other half of the armature in the other, producing a field about the armature, but as the

armature revolves the points of incoming and outgoing current are being continually moved, so that a moving field is the result, and as this means continuous stress, the rotation of the armature is maintained, and the power is greater as the stress is greater, the strength of the two fields determining this.

To put it in another way briefly, the north pole of the field magnet attracts the south pole of the armature which is produced near where the current, say, enters the armature winding, and the south pole of the field magnet attracts the north pole of the armature at the same time repulsion between the like poles of the armature and the field magnet is occurring, and the joint effect is that a couple is produced tending to turn the armature until the attracting poles coincide. The commutator, by shifting the points of ingress and egress of the current continuously, in effect moves the poles of the armature continuously, so that the attraction and repulsion is being constantly exerted and so maintain rotation of the armature.

Counter Electro-motive Force.—The law that a conductor cutting lines of force has an E.M.F. developed in it depending on the number of the lines and the speed with which it cuts them, operates in a motor so as to produce a force in the armature in a direction opposing the exciting force. On account of this counter E.M.F. the current which can be sent through a motor armature by a given E.M.F. varies with the speed at which the armature is running; if it be forcibly prevented from turning, the current is greatest, being simply due to the E.M.F. divided by the resistance, but when the armature is allowed to revolve, the current decreases as its speed increases. This tends to make the motor self-regulating as to current absorbed in proportion to load and as to speed, for if the motor is having heavy work to perform the speed tends to become reduced, and therefore the counter E.M.F. allowing more current to pass the armature, more power is given to do the increased work. Lighter work tends to allow the speed to increase, which develops more counter E.M.F. in the armature, reducing the current and consequently the power.

Alternating Current Motors.—With constant current supply there has been no difficulty in driving motors, and one of the advantages urged in its favour was this fact; but now that the alternating current, with its many other advantages, is so well to the front, alternating current motors are receiving considerable attention from our electrical engineers.

Many attempts have been made to produce such motors from designs like those of direct current ones, except that their field magnet cores had to be laminated as well as those of the

armatures. Owing to troubles with self-induction and magnetic lag, motors constructed in this manner proved to be most inefficient. The motors which run with good efficiency, and which are likely to be largely used in alternating circuits, have for their principle the induction of currents in closed or "short-circuited" coils in the armature by an alternating field.

Supposing the armature to be stationary and the field excited, the currents induced in the armature windings are neutral with regard to those of the field. As soon, however, as the armature is set in motion this neutrality ceases, and a turning effort is induced by the reaction of the fields on each other, which increases as the speed rises until synchronism between the two fields is approached. Although self-exciting, this form will not start, but if initially started it rapidly speeds up to a uniform rate, the direction of rotation depending upon the direction given at the start. By a recent addition the magnetic field has been made rotary by having two windings in the field magnets, differing in self-induction, connected in parallel; as soon as the motor has attained its proper speed one winding is cut out, and the motor continues to run as a single phase motor. The necessary difference in the self-induction of the field circuits may be obtained either by inserting condensers, resistances or coils having self-induction in series with one of windings, *i.e.* the one to be cut out when working speed is attained.

Let me now direct your attention to some of the main advantages of an electric motor over other motors at our disposal, such as steam, gas, oil or water-engines.

Simplicity.—There is absolutely no technical skill required to handle an electric motor. Turn a switch and it starts or stops; turn a multiple switch and by means of resistances the speed can be varied. No knowledge of pressure or water-gauges, of valves, exhaust, &c., is required.

Attendance.—The electric motor may be said to require absolutely no attendance beyond occasional oiling of its bearings; no stoking of boilers; no cleaning; hardly any repairs. It adjusts itself to any load within its range.

Range of Power.—A feature of the electric motor is the ease with which they may be designed to have the power of a watch or to that of the largest locomotive.

There is an example of a motor designed for winding an ordinary clock and here one of 5 horse-power.

Compactness.—In proportion to the power developed in an electric motor the space it occupies is extremely small. Its size depends largely on the speed its armature is intended to

revolve at, but even at low speeds an electric motor is smaller than any other motor.

Safety.—A steam-engine with its dangerous boiler, a gas or oil-engine subject to explosion, could not well be placed by an architect inside a house. No fear of danger of any kind need deter you to put an electric motor right into a drawing-room as it is so absolutely safe.

Position.—An electric motor can be placed anywhere conveniently in a house; it requires little fixing, hardly any foundation; it is not unsightly, and owing to the fact that it can be started and stopped from any distance, it can be placed in ordinarily inaccessible places.

Cleanliness.—It is absolutely clean, not even the oiling of its bearings need cause any dirt or mess; can we say this of other motors?

Noiselessness.—Compared to a gas or oil-engine, an electric motor is quite noiseless; some of the alternating motors at high frequency issue a kind of hum, but direct current motors are quite noiseless.

Efficiency.—The efficiency of electric motors of the larger sizes is very good, and ranges from 60 to 80 per cent. As they are self-regulating there is little waste when run on small loads, but their main efficiency and economy lies in the fact that they consume power only when doing work.

With such a convenient and efficient motor at the disposal of the architect, we may expect to see it figure largely in many of his plans and undertakings. It must, I think, influence his future considerations in building our dwellings, public edifices and factories. A few such likely considerations occur to me.

Factories.—I feel confident that the invention of the electric motor will revolutionise the planning and building of our factories. At present our mills and factories for the most part are driven by steam power, and it is essential to bring the machines as near the source of power as possible, in order to avoid the cost and waste inherent in transmission by shafting and belting. No such consideration need affect the designing of our factories in the future. The power of the electric current can be transmitted easily, cheaply and practically without loss through two wires; the motors can be placed directly near or upon the machines to be driven.

Home Industries.—Not only will the factory buildings themselves be constructed on different lines owing to this fact, but I look forward to an increase of home industry in which the several members of a family may be employed. From a social and economical point of view, this will prove a great advantage

to many an industry and to many a community. It will, of course, receive due consideration in planning the construction of our workmen's dwellings. I look forward to the employment of electric motors in large public buildings, hotels and in private houses.

Ventilation.—I believe this is an important question for architects, and one which has not yet found a definite solution. The usefulness of the electro motor in driving fans for ventilation has been again and again demonstrated and recognised. There can be no doubt that it will be employed largely for this purpose in the future, and will therefore have a considerable influence in the construction of buildings that require proper ventilation.

Lifts, Cranes and Trams.—At present lifts are only used in large buildings, because the power required is costly or requires room, or cannot be obtained conveniently. No doubt, with such a source of power as the electric current within the reach of private houses, we may look forward to seeing lifts, cranes and other methods of mechanical conveyance introduced into smaller houses. I suppose the want of such mechanical conveyance is now influencing the construction of many a house. Why should the kitchen be near the dining-room if we can get our dishes sent into the room by merely pushing a button?

Electric cranes have done good work in docks, and are much preferred to steam cranes. I think they will be largely employed in many of the operations necessary in the construction of buildings.

Many other instances could be cited to prove the usefulness of the electric motor, and I cannot urge too strongly upon architects the desirability of studying this question, and employing the electric motor wherever possible.

I will now refer to heating by electricity. Imagine a house built without flues, without chimneys, without hot-water pipes, and yet perfectly heated, perfectly ventilated, and with perfect cooking arrangements. Such a house could be built to-day, if we call electricity to our aid. Many such houses, I doubt not, will be built within a not too distant period. Imagine the question of smoke abatement solved in this way.

Heating by electricity is no new invention, in fact every current flowing through a conductor produces heat in proportion to the resistance of such conductor, expressed by the law C^2R , or heat equals the square of the current multiplied by the resistance. The application of such heating to industrial and domestic uses on anything like a practical scale is comparatively new, scarcely two years old. It is the natural

THE MOST PERFECT AND RELIABLE SYSTEM OF VENTILATION AND HEATING FOR SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

outcome of the fact that we can procure in our houses a practically unlimited supply of current.

In a few words, and with some experiments, I will endeavour to explain to you the method which I have adopted in the manufacture of electrical heating apparatus; but first I would remark that in the production of electric light, whether arc or incandescent, we have an instance of the generation or development of heat of high degree in the passing of a current through a resistance; indeed, the heat produced in the arc is the most intense that can be obtained by the ingenuity of man. The resistance used in an incandescent lamp is a carbon wire, or, as it is usually termed, a filament. If made incandescent in the presence of oxygen, it would burn up; therefore we place it inside a glass globe, which is then exhausted of air. Here I have a number of such carbon filaments, all of same resistance. I will conduct the current through some without the protecting exhausted globe, some in globes partially exhausted, and some in globes completely exhausted of air. This will demonstrate to you the value of a vacuum in an incandescent electric lamp. For heating by electricity we employ metallic resistances, such as platinum, iron, or alloys. Carbon has not been practically used much, although I believe we shall in time use it for improvements. Just as in the electric lamp, so we have in this case to take precautions against the undue burning up of the resistances, and this we do by embedding them in a substance which is a non-conductor of electricity, which also protects it from oxidation, and at the same time will, by its close proximity to the surface to be heated, conduct away readily the heat produced in the wire resistance. This substance is either refractory cement or vitreous enamel. I will demonstrate to you the effect of embedding wires in this manner.

To heat the atmosphere in our room we make radiators or stoves; we can heat either by radiation or convection.

Here is such a radiator; the heat produced in the wire resistance embedded in the cement is transmitted to an iron surface having many projections and blackened. It requires a current of 10 amperes at 100 volts to warm a room of about 3,000 cubic feet. This method of heating the atmosphere by electricity is still too young to predict the success of its ultimate employment in preference to heating by coal or gas.

What I wish to demonstrate is that it can be done, and that such heating would present certain qualities (whether advantageous or not I will not judge) which are not possessed by the present methods at our disposal, and which are mainly:—There is no combustion; consequently there is no air required and

no oxygen consumed. There is no flue wanted. The apparatus can be placed in many positions impossible with the old arrangements. The heat can be subdivided and more easily directed and concentrated upon the space to be heated. It is perfectly clean. It is always ready, and requires no manual labour for starting.

Cooking.—The application of electricity to our cooking operations will no doubt effect quite a revolution in our households, and will influence the planning of our buildings accordingly.

We now make all apparatus and utensils usually employed for cooking. Technically they are made in the manner I have already explained. Ovens are fitted with small radiators at the sides and top. An "electric oven" is, in contrast to the blackness of coal and gas ovens, made of bright brass or tinned iron; as bright as possible inside to procure reflection of heat and bright and highly polished outside to prevent radiation.

Here are kettles, saucepans, grillers, toasters, fish kettles, &c. These have the resistance wires embedded in cement underneath on the outer surface of their bottom plates, and are thus brought into close proximity to the liquid or material to be heated, so that the heat is at once transmitted thereto, and by having such articles as kettles and pans polished extremely little loss occurs through radiation. All the usual necessary operations of cooking can be performed by electricity, and I have it on the authority of experts, including City aldermen, that the quality and perfection of electrically cooked viands is indisputable, and that the method is far superior to our present old-fashioned ones.

The employment of electrical heating for other purposes in our houses has not been neglected. Ladies can have their electric hair curlers, gentlemen their electric shaving pots. A great future lies open to electrical heating in industrial applications. We make many irons for laundries, tailors, as well as for domestic use, and they are much appreciated as offering great advantages.

Another interesting application I may instance is that of electrically heated branders, for packing cases, bacon, and branders for bookbinding. In electric welding we have an instance of the intense heat generated or produced by the passage of a large current through the resistance of the metals being welded at their points of contact, and it shows how readily the parts necessary to be heated can be operated upon when done electrically.

In short, I may affirm that there is not a single operation performed in our daily life by coal or gas that cannot also be

performed by electricity, and that mostly in a superior and more advantageous manner.

Electric Lighting.—I do not propose dilating upon the advantages of the electric light, its beauty, safety from fire, non-consumption of oxygen, its decorative uses, &c. All these have been dwelt upon so often. But may I seize the opportunity I now have of talking to architects to say a few words upon a subject in connection with electric lighting, a subject which, to my knowledge, has so far received but little ventilation before architects, to whom it must mean a good deal?

This subject is, the wiring for the electric light.

The method adopted in this and many other countries is to run two wires in wood casing, having two grooves in it.

This method is a compromise between the electrical engineer and the fire-insurance inspector; the third party who ought to have a voice in the matter has never been consulted—I mean the architect.

I have heard many architects complain that this method is one which does not commend itself to them; it is difficult and sometimes impossible to provide for it in new houses, and often disfigures the walls of existing buildings to be installed with electric wires. By some it is looked upon as a necessary evil. I may affirm that this need not be so. We are not married to this system. I feel confident that a departure from present arrangements could be effected which would be appreciated both by the builder and the architect. I feel sure that the co-operation of the architect and electrical engineer will eventually produce such a modification as is felt to be desirable and even necessary by the electrical profession itself.

This brings me to say a few words about the education in matters electrical of an architect. Doubtless many a one is giving the subject his earnest consideration, but I think all architects should acquaint themselves with the elements of applied electricity. Every architect to my mind should have a fair conception of the meaning of such terms as "Volt," "Ampère," "Ohm" and "Watt." He ought to be familiar with the law known as Ohm's, which teaches us that the current flowing in a circuit is equal to the electro-motive force divided by the resistance; that the resistance multiplied by the current equals the E.M.F. Again, that the E.M.F. divided by the current equals the resistance. Again, he ought to know Joule's law—that the heat or work done in an electrical circuit is as the square of the current multiplied by the resistance, or is as the E.M.F. multiplied by the current. He ought to be familiar with the properties of wires, their

carrying capacities, their resistances, and of materials used for insulating those wires necessary to fit them for use in electrical installations. A knowledge of these and similar subjects would be of considerable service to him in preparing his plans for our modern buildings, which will be all the better for being supplied with all the comforts and luxuries capable of being bestowed upon us by making electricity our servant.

Cost.—I have so far in these notes refrained from referring to what would be the cost of employing the electric current for the purposes I have been speaking of. Doubtless, you will say, here lies the crux of the whole question. There can be no doubt that the operations can be performed, but they would be of little practical value if their cost should be beyond your clients' means. My reply to this is that the cost is not excessive or beyond the means of the moderately rich, even at the price at which the current is being generally sold, but there are indications and grounds sufficient at hand that may lead us to expect that one day electricity will also supply energy for light, power and heat to the poor.

The present ruling price is capable of being reduced to a great extent, and the very fact of its being used for motive power and heating will necessarily bring down such price.

At present the average charge for current is 6d. per unit for lighting and 3d. per unit for other uses during the day. Mr. Crompton in a paper on the cost of electricity gives the actual works cost of current, that is for coal and wages, at ½d. per unit. The rest of the cost, such as maintenance, interest on capital and management, is in a measure governed by the load factor or the proportion to daily load compared with the capacity of the plant, and if this is large and well-distributed, as it will be if heating, cooking and motive power come to be used, the percentage of such extra cost to be charged in each unit will be small, and we may look forward to seeing electricity sold in our houses at or near 2d. per unit—a price at which electricity will be able to compete with coal or gas for light as well as for power and heat, and be in many instances cheaper.

We may with confidence look forward to being able to obtain, at a not too distant period, cheap electric energy, concurrently with perfect and economical apparatus for employing it for lighting, power and heating. In view of this, architects will do well to contribute to the early and general adoption of electricity for such purposes, and thorough co-operation of architects and electrical engineers will, I feel confident, be of great value and conducive to the furtherance of the objects which this Congress of Public Health has at heart.

QUARRYING METHODS OF THE ANCIENTS.

(Concluded from last week.)

IN sinking shafts in rock the work of the ancient Egyptians is quite equal to that of any succeeding race. Perhaps the most remarkable shaft known is that of Joseph's Well at Cairo. The upper portion of this remarkable work is rectangular in cross-section, measuring 14 feet by 18 feet, and is excavated of these dimensions through solid rock to the depth of 165 feet, at which level it is enlarged into a capacious chamber, in the floor of which is formed a tank to receive the water elevated from below. On one side of this tank, which is immediately at the bottom of the upper shaft, another shaft, 15 feet by 9 feet, but not in a line with the first, is sunk 130 feet lower, where the rock ceases, and a stratum of gravel is found which furnishes the supply of water, which is raised into the tank at the bottom of the upper shaft by machinery propelled by horses or oxen working within the chamber. These animals reach this chamber by descending a series of inclined drifts which pass around the upper shaft in a manner similar to what is known as a "spiral stair." These drifts are separated from the interior of the shaft by a wall of rock not more than 7 inches thick, and segmental apertures are cut through it to light the drifts from the shaft. The lower shaft is also provided with an inclined path cut out of its sides and descending to the water, but there is no partition between it and the well.

There has been a great deal of speculation relative to the means by which the Egyptian engineers carried the first shaft down, preserved the angle of the descending drifts and maintained the uniform thickness of the thin partition separating the drifts from the shaft. Without doubt the shaft was carried downward by hand tools somewhat in advance of the drifts, and as it progressed the line of inclination of the floor and roof of the drifts was laid out on its sides, and the segmental light openings pierced; through these it was easy to remove the material from the drifts, and to transfer the angle of the top and bottom of the drift from the lines established on the walls of the shaft. The position of the back wall of the drift could easily be accurately located parallel with the wall of the shaft by measuring through these light openings.

The tools used by the Egyptians for quarrying and stone-cutting were sometimes made of bronze and sometimes of iron. Herodotus states positively that iron tools were used in the work on the Great Pyramid, which is probably the oldest structure erected by man now remaining. In his explorations of

this pyramid Colonel Howard Vyse found a thin plate of iron embedded in the mortar between two of the courses of stones, where it had undoubtedly been placed more than five thousand years ago. Among the ruins of Naucratis (600 B.C.) there were found a few years since, in what appeared to be the remains of a manufactory of iron implements, twenty-eight iron or steel chisels evidently designed for cutting stone or iron.

It is a singular fact that none of the very few bronze tools that have been discovered are now sufficiently hard to be used for dressing stone, and it is not at all probable that such tools were used except for the softest materials. The reason why so few steel and iron tools have been discovered is doubtless to be found in the perishable character of these metals, for unless tools made of them were placed in a position free from air and moisture the sharp and hungry tooth of oxygen would rapidly gnaw them to destruction.

In addition to tools of iron, steel and bronze, the early Egyptian workers in stone without doubt employed tools similar to the "diamond drills," and "diamond saws" of our day. Mr. W. M. Flinders Petrie's work descriptive of "The Pyramids and Temples of Gizeh" exhibits some of the evidence he has discovered of the use of diamond drills and saws. It is not certain that the diamond was the jewel used to arm these implements, but it is certain that the Egyptians were acquainted with a cutting jewel far harder than quartz, and that some such jewel was used as a sharp-pointed grooving tool is placed beyond doubt by the fragments of diorite bowls with inscriptions of the fourth dynasty which were found by Mr. Petrie at Gizeh. "These inscriptions were not scraped or ground out, but were ploughed through the diorite. As the lines are only $\frac{1}{150}$ inch wide (the figures are about $\frac{2}{10}$ inch long) it is evident that the cutting-point must have been much harder than quartz and tough enough not to splinter when so fine an edge was being employed—probably only $\frac{1}{300}$ inch wide. Parallel lines are grooved only $\frac{1}{30}$ inch apart from centre to centre."

That the blades of the saws were of bronze is proved by "the green staining on the sides of the saw-cuts and on grains of sand left in the saw-cut." The forms of the tools in which jewel cutting-points were employed "were straight saws, circular saws, tubular drills and turning-tools for lathes." "The straight saws varied from $\frac{3}{100}$ to $\frac{2}{10}$ inch thick." "The largest were 8 feet or more in length." The tubular drill-holes vary from $\frac{1}{4}$ inch to 5 inches in diameter and from $\frac{1}{5}$ to $\frac{1}{2}$ inch thick. The smallest hole yet found in granite is 2 inches

n diameter, all the lesser holes being in limestone or alabaster, which were probably worked merely with tubes and sand.*

The lathe appears to have been well known in the fourth dynasty (about 3600 B.C.). Diorite bowls and vases of the old kingdom are frequently met with and show great technical skill.

For dressing stone the "points," "chisels" and "mallets" used were quite similar in shape to those employed at the present time. After working "chisel-drafts" around the sides of the area to be dressed the workman applied two "parallel-blocks" to the surface of the "chisel-draft" and stretched a string across the stone from the top of one "parallel-block" to the other, and then by applying another "parallel-block" to the surface of the stone in contact with one side of the string it was easy to note the depth to be removed. This method was employed only on vertical surfaces, to avoid the error arising from the "sag" of the string if used on a horizontal side of a stone. In case a less degree of accuracy was satisfactory the string was simply stretched by the hand.

"Sometimes saws were used instead of 'chisel-drafts' to lay out the work; grooves were cut about half an inch deep around a block and the hammer-dresser trimmed it down to the plane of the grooves. Often in the case of sawn blocks the surfaces to be placed in contact were roughly hammer-dressed to leave sufficient space for the cement; while just around the edges of the surface they were left quite smooth. Hence the stones would be in contact and the joints quite microscopical on the outside, while there was a fair thickness of cement on the extremely roughened surfaces inside the joint. The average thickness of the visible joints of the casing stones of the Great

Pyramid was $\frac{1}{50}$ inch in 6 feet in length. The levelling of the stones was very exact, $\frac{1}{50}$ inch variation in 100 square feet area, and a like amount in 40 feet length of joint, was the largest noted. Surface plates were used, smeared with red ochre paint, and when the stones were too large for the plates diagonal drafts or saw-cuts were run." "On the sides of the forty-three granite beams (averaging 50 tons weight each which roof the King's Chamber, and the spaces above that [in the Great Pyramid], the workmen's lines may be seen in red about half an inch wide. There are usually a line some definite distance from the dressed face, from which dressing was gauged; a mid-line at half the length of the beam; a line near each end showing where it should be placed upon the supporting walls; a line one cubit from each end, by which the lines of support could be measured off in case they were defaced; small lines in black about $\frac{1}{10}$ inch wide marked on the red in some parts to give more definite points of reference." "In lining a rock tomb with fine stone each course was not gauged to a uniform height before it was built in, but after laying it a red line at the level of the lowest stone was run round the course to mark where the dressing-down was to be done."

In India a peculiar hammer and chisel seem to have been used, the hammer being quite different from the wooden mallet employed by the ancient Egyptians. Mr. Alexander Kennedy states* that "the only tools which they [the Indian stone-dressers] employ are a small steel chisel and an iron mallet. The chisel is short, probably not longer than twice the breadth of the small hands which work it. The chisel tapers to a round point like that of a drawing pencil, and this I believe to be the only shape given to the points of their chisels. The mallet I have seen is of iron. It is somewhat longer than the chisel; its weight cannot exceed a few pounds. The head, set on at right angles to the handle, may be from two to three inches long. It has only one striking face. The striking face is formed into a deep hollow, which is lined with lead. Having with these two instruments only brought the stone to a smooth surface, it next undergoes the dressing with water in the usual manner with masons. It now only remains to apply the black shining polish, which is done as follows:—A block of granite of considerable size is rudely fashioned into

* In the early part of this century an English patent was granted to James Murdoch (the inventor of the slide-valve and chief assistant to James Watt) for a method of manufacturing water-pipes of stone. The stone of which the pipes were made was bored by means of a thin hollow cylinder of soft iron to which an alternate rotary motion was given, its lower end being copiously supplied with sand and water. In the years 1810–14 the Manchester and Salford Water Company laid water-pipes of limestone (bored by Murdoch's method) in the streets of Manchester. The bore of these pipes varied from 3 to 18 inches and they were made in lengths of about 2 feet. The prices paid for the various sizes were as follows:—

3 inch bore, 4s. 11d. per yard	9 inch bore, 18s. 8d. per yard.

the shape of the end of a large pestle, the lower face is hollowed out into a cavity, and this is filled with a mass composed of powdered corundum stone mixed with beeswax. This block is moved by means of two sticks, or pieces of bamboo placed on each side of its neck, and bound together by cords twisted and tightened by sticks. The weight of the whole is as much as two workmen can easily manage. They seat themselves upon or close to the stone they are to polish, and by moving the block backwards and forwards between them the polish is given by the friction of the mass of wax and corundum."

Relative to the means taken by the native workmen to ensure the horizontality of the bottom of the socket in the flinth of the Seringapatam obelisk, Colonel Wilkes says:—"I was satisfied with the means taken for insuring a true horizontal surface for the base of the shaft, but its stability entirely depended on equal accuracy in the surface of its receptacle, and seeing no mode by which, with their rude instruments, this object was to be attained, I so far departed from my first intention as to offer them a spirit-level and instructions for its use. They quickly understood and admired the contrivance, but were afraid of venturing on new methods; their own was (as they affirmed) more slow but equally certain, and they invited me to inspect it. The surface was rubbed lean and dry, and some water was dropped on it. The water ran. You see," said the engineer, "the high and the low." He dried up the water and applied the chisel to the higher portion of the surface, and by the patience and perseverance of several days the surface was perfectly polished and a drop of water remained stationary wherever it was placed. The whole obelisk received a very fair degree of polish from corundum. A piece of plank spread with a sort of cement used for setting sword-blades in their handles; whilst this substance is still liquid it is mixed and powdered over with pulverised corundum (reduced to a coarse or fine sand according to the purpose for which it is intended), and then left to dry in the sun. These planks weighted over are then used like the slabs of the stone-polisher in England."

Much more of interest might be said, but the boundaries of our limited space have already been passed, and I am admonished to forbear, and as I relinquish my pen I am reminded that with all their technical skill the ancient delvers never—so far as we are at present advised—attempted to quarry a magazine article out of history, and have it fill with precision the allotted space.

INCANDESCENT GAS-LIGHTING.

At the annual meeting of the North British Association of Gas Managers, in Glasgow, Mr. R. S. Galloway, Edinburgh, read a paper on incandescent gas-lighting, the introduction of which was due to Dr. Carl Auer von Welsbach. With the discovery of gas-lighting, he said, had entered upon a new epoch. The ordinary manner of burning gas was most wasteful and inefficient, and many patents had been taken out to utilise a gas flame as a heating instead of a lighting medium. But none had been successful till Dr. Auer von Welsbach took up the subject. The point of excellence in his invention was that immediately the gas was lighted the light-giving body or mantle was raised to its highest incandescence, and this without any forced pressure or alteration of existing fittings. All other systems which had been tried (and soon abandoned) had necessitated either artificial pressure or else the incandescence had not been attained for some considerable time. It must be understood that the Welsbach light did not owe its origin to the competition of electric light, but to accidental discoveries in the course of purely scientific studies. The advantages of this invention will be at once apparent by the following figures, and in placing these before them he must inform them he was dealing with Scotch gas or, to be more particular, gas made from Scotch coal. By tests made on the photometer, it was found that a No. 7 Bray burner gave 5 candle-power per cubic foot of gas used, while an incandescent "C" burner gave from 18 to 20 candle-power. Moreover, a No. 7 Bray burned 5 cubic feet per hour against 2½ cubic feet for an incandescent and 6 cubic feet for an Argand. That was, an incandescent burner, burning 50 per cent. less gas, gave three times more light. Then as to its advantages over electricity. An ordinary incandescent electric lamp gave 16 candle-power nominally; therefore more than three electric lamps would be required to give equal results to one incandescent "C" burner (gas). Taking 2,000 hours as the average burning time in a year—i.e. as nearly as possible five hours per day all the year round—the cost of electric current at 8d. per Board of Trade unit would amount to over 11l.; whereas the cost of the "C" incandescent gas-burner consuming 2½ cubic feet of gas per hour would be, with gas at 2s. 8d. per 1,000 cubic feet, 13s. 4d. To put this in another form:—For a given sum of money an ordinary 5 feet per hour gas-jet would give three times the light, and an incandescent gas-burner would give over twelve

"OPTIMUS" IMPROVED PATENT WIDE ANGLE CAMERA. EXTRA LONG FOCUS.

British Journal of Photography says:—"The present Model Rayment Camera is among the very LIGHTEST and RIGID Cameras offered to the Public. The RAPIDITY of OPENING and CLOSING is greatly facilitated by the arrangement for throwing the pinion out of gear from the rack. There is NO CURTAILMENT of VIEW when of short focus and wide angular aperture are in use."

times the light of an incandescent electric lamp. Moreover, it must be distinctly understood that when more than 2½ feet of gas was passed through an incandescent burner complete combustion seldom took place, and consequently the light was diminished. The same applied to too rich gas—that was to say, as good a light could be got from 15 or 18-candle gas as from 25-candle gas. This to gas companies where incandescent lighting was adopted would help to recompense them for a reduction in their sale of gas. He claimed that the light was practically one-eighth the cost of electric light; that it was from one-tenth to one-fifth the cost of other systems of gas-lighting; that its hygienic advantages were not obtainable with any other system of gas-lighting; that it could easily and readily be attached to existing fittings; and that it was suitable for all inside and outside lighting.

KENSINGTON COURT.

THE London County Council, having failed in the long litigation against the builders of the new mansions facing Kensington Gardens, are now trying to pursue the owner. A summons against Mr. Worley was taken out for an offence under section 85 of the Metropolis Management Act, and the case was heard before Mr. Curtis Bennett, by whom it was dismissed. An appeal was brought in the Queen's Bench Division on the 2nd inst. Mr. Poland, Q.C., for the Council, said the respondent was summoned by the London County Council for that he, on December 31, 1893, and on succeeding days up to and including March 7, 1894, at Kensington Court, committed an offence under section 85 of the Metropolis Management Act, 1862, by unlawfully erecting a building of a height beyond that permitted by the statute without the consent in writing of the London County Council, and for suffering the building to continue to be erected above the said height. At the hearing of the summons it was proved or admitted that the building in question had been erected for the respondent, and that it had been carried above the height specified in the section under his directions, and after notice from the London County Council that proceedings would be taken. The County Council, in the first place, proceeded against the builders, but the magistrate dismissed the summons. There was an appeal to the Queen's Bench Division, and the magistrate was directed to convict. The County Council afterwards desired to recover continuing

penalties of 40s. a day, but they could not proceed against the builders as they had finished the work and left the premises and therefore they had taken these proceedings against the owner. It was contended for the respondent that he was not liable to pay any penalty for the continuing offence as he had not been summoned for or convicted of the original offence and that he could not be convicted of the original offence because proceedings were not taken against him within six months of the commission or the discovery of such offence. Mr. Dickens replied for the respondent. Mr. Justice Mathew said he had no doubt that the respondent was liable to pay continuing penalties. The only limitation in the statute was that the local authority could not recover penalties for offences committed more than six months before the proceedings were instituted. The case would be remitted to the magistrate to be dealt with.

Mr. Justice Kennedy said he concurred in the judgment of his learned brother, but not without some hesitation.

THE DRAINAGE OF MANCHESTER.

A PAPER on the main drainage works of Manchester was read by Mr. W. T. Olive, the resident engineer, at the meeting of the Institute of Mechanical Engineers in that city.

Mr. Olive said that the instructions to carry out the scheme of the new main drainage works were issued by the City Council in April 1889. In the autumn of that year the first contracts were let, and operations were commenced in the beginning of 1890. Since that time the work has been continuously in progress, and has comprised twenty-two contracts for main intercepting sewers, tanks, buildings, and machinery and filtering beds. Previously to 1885 the area of Manchester was 4,296 acres, and the population 341,414. In that year the area was increased to 5,929 acres, and in 1890 six townships were added, comprising an area of 6,861 acres, so that the total area is now 12,790 acres, and the population about 515,600. The plan now being proceeded with is an intercepting scheme, whereby as far as practicable the new main sewers are carried along the valleys at such depths as to intercept the existing sewers and convey all the sewers to one main outfall, which forwards it to the sewage works at Davyhulme, five miles distant from the city. A gravitation system has been aimed at and attained, although in some places at the expense of very

at gradients. Nevertheless, it is believed that the sewers will be perfectly self-cleansing. The calculations for the sizes of the sewers have been based upon a present daily water-supply of 20 allons per head, together with five gallons as a margin for increase and for subsoil water; in all 25 gallons per head for a respective population of 625,000, together with a rainfall varying in different parts of the district from 3-16th inch up to 1 inch in twenty-four hours. The storm-overflow sewer discharging into the Ship Canal at Mode Wheel is so constructed that nothing can flow through it until, with the addition of rainfall, the volume flowing down the main outfall sewer at its junction with the storm-overflow sewer exceeds six times the normal flow of sewage from the whole area draining into the main outfall sewer. If at any time the flow down the storm sewer should injure the water in the Ship Canal, the Corporation can be called upon to raise the level of the weir at the junction to such a height that nothing can flow into the canal until the volume flowing down the main outfall sewer exceeds eight and a half times the normal flow of sewage from the whole area. With regard to subsoil water, from gaugings taken the author has been able to ascertain that the subsoil water entering the Manchester sewers per acre of sewer surface is at the rate of only 17,300 gallons a day, or 1.92 cubic feet per minute. The main intercepting sewers vary in size from 14 feet wide by 2 feet high to 14 feet by 10½ feet. All the sewers up to 5 feet diameter have been built in two rings of brickwork, from 5 feet to 10 feet diameter in three rings, and the main outfall, which is 14 feet wide by 10½ feet high, in four rings. In the smaller sewers blue bricks have been used for the inner ring and common reds for the outer or back ring. Both hydraulic lime and cement mortar have been used, whichever was considered most suited to the nature of the ground. By far the larger portion of the work has been done in tunnel. The strata have been for the most part sandstone rock, boulder clay, sand and ballast, and a little running sand. The greatest difficulties to contend with have been presented by the old sewers, which to a large extent follow the same lines as the new, sometimes running about the same level, side by side, or crossing over, under, or through. In two instances men have been drowned owing to the bursting of these dangerous and often badly constructed old sewers; and many times have the workings been flooded thereby. Special ironwork has had to be made, and storm-overflow chambers have been built over the old sewers wherever tapped, so that only the right amount of sewage and storm-water should enter the new sewers and

the rest should flow over a weir and down the disused portion of the old sewers to the rivers. Twice have old tunnels from the rivers Irk and Medlock to adjoining mills been cut through at great expense and trouble and some danger. In one place a disused canal branch, the existence of which was not known, was tapped and the workings were flooded, the men narrowly escaping with their lives. At Erskine Street, Stretford Road, there is a large junction-chamber or bell-mouth, where the combined flow of a 7-foot and a 9-foot sewer discharges into the main outfall sewer of elliptical section, 14 feet by 10½ feet. The length of this sewer to the storm-overflow chamber is about 3,535 yards, or just over two miles, and it varies in depth from 37 feet to 45 feet below the surface of the ground. The storm-overflow chamber measures 51½ feet long by 27 feet 2 inches wide. In passing under the Bridgewater Canal the main outfall sewer had to be constructed in two cast-iron cylinders, each 8 feet 9 inches diameter, owing to lack of head-room and the stipulation that a depth of 9 feet in place of 5½ feet was to be provided. The work was done, half at a time, by means of coffer-dams made of sand, and the canal had to be temporarily widened in order to provide for an uninterrupted traffic. From the storm-overflow chamber to the tanks, a distance of 4,259 yards, or 2.42 miles, the main outfall sewer is diminished in size to 10 feet diameter with a fall of 1 in 2,000. It averages 15 feet deep, and has been laid in open cutting and through fields. With regard to outfall works, Mr. Olive said that the Corporation are under obligation to treat chemically, and also to filter subsequently through land the effluent of the dry-weather flow of sewage from the population of the city, equal at 4 cubic feet per head to a quantity of 2,400,000 cubic feet per twenty-four hours upon a total population of 600,000, or 2,500 cubic feet per minute, assuming half the total flow to pass in eight hours. The buildings are designed in a conventional style of architecture, and somewhat resemble a modern farm building. He further described the buildings in use. There are eleven settling tanks, all open to the air, each 300 feet long and 100 feet wide, having an average depth of 6 feet, a total water surface area of about 7½ acres, and a holding capacity of 12½ million gallons. The floors are of cement concrete, and all the walls of brickwork. The floors of the tanks are level transversely, and fall 1 in 150 from the overflow end to the inlet end. After the sewage leaves the 10-foot outfall sewer it flows through a screen inclined at an angle of about 60 degs. with the horizontal. Immediately behind the screen the chemicals—sulphate of

alumina and milk of lime—are added, and thoroughly mixed with the sewage by means of an agitator. The water then passes on into the channel through the sluice ways, and is admitted into any particular tank by means of small sluices provided for that purpose, three to each tank. In sudden and heavy storms, when the amount of water is too great to be properly coped with, other sluices may be opened. The land owned by the Corporation for filtration, apart from that occupied by the tanks and buildings, is about 325 acres, namely, 112 acres at Davyhulme and 213 acres at Flixton, two miles distant. Only thirty acres are at present laid out, in two beds. The beds are drained by 18-inch mains, socketed pipes with puddle joints, laid about 200 feet apart and parallel to the centre bank; into these pipes 6-inch agricultural drain-tiles laid 30 feet apart are connected. In addition to the area of 123 acres acquired in 1888, powers have since been taken for the acquisition of a further quantity of land for filtration in the townships of Carrington and Flixton, near the junction of the Manchester Ship Canal with the river Mersey. This area contains about 213 acres. It has been selected with the view of obviating the necessity for pumping the effluent, which can be delivered by gravitation upon 180 acres; and this area, together with the portions at Davyhulme devoted to filtration, amounts in the aggregate to about 240 acres, which is estimated to suffice for a total population of 600,000, or at the rate of 2,500 persons per acre. A description of the machinery in use at the works was also given by Mr. Olive. The two pumps by which the sludge is pumped up from the sludge well into the sludge pits are fixed in the well, and are of the horizontal direct-acting kind known as the "special" steam-pump. The steam cylinders are 12 inches diameter and the sludge barrels 9 inches diameter, with a stroke of 24 inches, both double-acting; each pump is capable of raising 290 tons of sewage sludge in eight hours to a height of 32 feet, or the two conjointly 580 tons. The installation of electric lighting at the works includes a vertical engine with 13-inch cylinder and 16-inch stroke to run at 130 revolutions per minute with a pressure of 80 lbs. per square inch. There is also a set of fifty-six storage batteries capable of running with lamps of 16 candle-power a maximum of 420 lamp-hours. The number of lamps at present in use is 134—14 arcs of 1,200 candle-power for outside use, 12 arcs of 500 candle-power for inside use, 88 incandescent lamps of 16 candle-power for inside use, 8 incandescent lamps of 50 candle-power on the approach road and 12 incandescent lamps of 32 candle-power in the subway.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

14145. John French Golding, for "Improvements in the construction of floors and ceilings."
 14147. John French Golding, for "Improvements in the construction of partitions for buildings."
 14168. James William Shephard, for "An improved levelling, also angle gradient and distance measuring instrument for surveying or other purposes."
 14178. Thomas Atkins, for "Improvements in flushing cisterns."
 14251. Alfred John Ball and John de Courcy Hickton, for "Improvements in fasteners for window-sashes and the like."
 14310. Robert Waugh, for "An improved bolt or fastener for windows, doors and the like."
 14318. James Charles Haste, for "Improvements in window-fasteners."
 14342. Frederick Howard Brooke, for "Improvements in bricks for paving and the like."
 14360. Richard de Mulinfeldt Lawson, for "Improvements in doors and windows for buildings, &c."
 14510. Daniel Griffin, for "A combination hinge, lock and sash-fastener."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

TRADE NOTES.

AT the recent exhibition held at King's College in connection with the British Institute of Public Health, much interest was evinced by experts in the well-known Parsons's radiators for warming buildings, models of which were on view. The opinion was freely expressed that their principle is the right one and a decided advance on similar apparatus. We also learn too that Messrs. Parsons & Harris, the makers, have several large orders for these in hand at their works in Sidney Grove, Goswell Road, E.C.

AT Winsters, Derbyshire, the parish church of St. John the Baptist has had a new quarter-chime clock erected in the tower, the gift of a gentleman who resides in the parish. It was constructed by Messrs. Wm. Potts & Sons, of Leeds and Newcastle-upon-Tyne, who are also making an illuminated quarter-chime clock for Hayfield parish church, in the High Peak district.

WE have been requested to inform our readers that Messrs. Baird, Thompson & Co., Limited, engineers and specialists in ventilation, heating, sanitation, cooling, drying and filtration, to enable them to expedite and facilitate the execution of their orders to the greater satisfaction of their numerous clients and to centralise their business generally, have removed their head offices to their new works at Islington. Their only address for London now is Charlton Engineering Works, Charlton Place, Islington, London, N. (directly opposite the Upper Street entrance to the Agricultural Hall), to which address all communications should be sent.

WE have much pleasure in announcing that Messrs. Pickering's, Limited, of the Globe Elevator Works, Stockton-on-Tees, have appointed Messrs. Bolton, Fane & Co., of 96 and 98 Leadenhall Street, their agents for London and district.

A LARGE clock was formally started at the church of Long Clawson, near Melton Mowbray, on August 9. It shows time on two large dials, chimes the Cambridge quarters, and strikes the hours. It has been carried out generally to the designs of Lord Grimthorpe, by Messrs. John Smith & Sons, Midland Clock Works, Derby. The whole is the gift of Dr. Swain, Long Clawson.

THE new workhouse infirmary, Guisborough, which is being erected from the plans of Mr. Thomas Stokes, architect, Thirsk, is now nearing completion. It is being warmed and ventilated throughout by means of Shorland's patent Man-

chester stoves, patent exhaust roof ventilators and improved inlet panels, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

VARIETIES.

THE authorities at Chatham Dockyard have in preparation a scheme for still further developing the extension works by constructing another basin. Plans are also to be prepared for three new docks; one of which is to be of immense size, and capable of accommodating the largest vessel likely to be built in the future. The need for larger docks is apparent, seeing that at Chatham there is not one of sufficient size to hold the cruisers *Powerful* and *Terrible*, provided for in this year's estimates. It is estimated that the total cost of the proposed works will be about 1,500,000*l*.

WE are informed that Messrs. Baird, Thompson & Co., Limited, have been successful in securing an important contract from the Japanese Government, for the introduction of their improved systems of ventilation. Lord Burton has also selected their improved system of heating for the New Municipal Buildings, Burton-on-Trent, and has instructed them to proceed with this contract. Amongst numerous contracts recently completed we may mention the following:—Darlaston New Schools, Darlaston; Yardley New Schools, Yardley; Infectious Diseases Hospital, Stratford-on-Avon; Bargeddie Public Schools, N.B.; Somerset Road Chapel, Handsworth, near Birmingham, and many others. They have also a large number of other contracts on hand.

THE Local Government Board have declined to sanction the borrowing of 27,000*l*. by the Chester Corporation for the purchase of 400 acres of land at Sealand.

MESSRS. DICKSON BROS. have obtained the contract for the Exeter, Teign Valley and Chagford Railway.

THE French Consul at Mongtze, in Upper Tonkin, has reported about the "wodmines." Originally they formed a pine forest, which the earth swallowed in some cataclysm. Some of the trees are a yard in diameter. They lie in a slanting direction and in sandy soils which cover them to a depth of about eight yards. As the top branches are well preserved, it is thought the geological convulsion which buried them cannot be of very great antiquity.

PLANS AND ESTIMATES FURNISHED FREE OF CHARGE ON APPLICATION.

THE plans by Mr. W. H. Radford have been adopted for the sewerage of West Bridgford, a suburb of Nottingham. The works will cost about 5,000/.

A LOCAL GOVERNMENT inquiry has been held at the Town Hall, Melton Mowbray, before Colonel J. Ord Hasted, R.E., of the Local Government Board, for permission to borrow 4,050/ for improvements at the sewage works. Mr. Edmund Jeeves, the surveyor to the Local Board, explained the scheme, stating that after investigating numerous systems of sewage disposal the Board had decided to adopt the International system of ferozone and polarite as being the most economical and efficient process. In addition to the polarite filters the works will be provided with three clarifiers to economise chemicals and save labour. There was no opposition, and it is intended to carry out the work forthwith.

BUILDING AND BUILDERS.

THE Local Government Board have written to the Islington Board of Guardians sanctioning the erection of a new infirmary for 750 patients at Bowes Manor, Bowes Park, N. The cost will probably exceed 125,000/. The draft plans have also been approved for the buildings, which will take a couple of years to construct.

THE Glasgow Discharged Prisoners' Aid Society are about to erect a reception-house at junction of Cathedral Square and John Knox Street. The site is a triangular piece of ground on the east side of Cathedral Square, and the building is to be three storeys in height, and will give accommodation on the basement floor or ground level for breakfast-hall, with kitchen, &c., for men. On the principal floor is office accommodation for superintendent and clerks, and also a large room for women. On the upper floor two apartments are provided for the caretaker, and dormitory accommodation for men. The architects are Messrs. Campbell Douglas & Morrison.

PLANS have been passed for an enlargement to the Broomloan Road Public School, Govan, providing additional accommodation for 925 scholars. The plans include a large swimming pond, as also a manual instruction workshop for boys and a laundry for girls. The estimated cost is about 17,500/., exclusive of site. The architects for the enlargement are Messrs. Barclay, of Glasgow.

THE Rhyl Improvement Commissioners have contracted for works which will entail an expenditure of about 24,000/.

A contract of 11,800/ is let to Mr. Briggs, of Birmingham, and consists of a new main drain and sewage outfall works, by which the sewage will be carried three-quarters of a mile out to sea, being discharged on the ebb tide, thus insuring its carriage right out to sea. The formation of the new marine lake is entrusted to Mr. G. Law. It will be nearly 30 acres in extent, and cost when completed about 8,000/.

NEWBURY TECHNICAL INSTITUTE.

THE new Technical Institute in Newbury, which was opened by Mr. Alfred Waterhouse, R.A., of Yattendon Court, occupies a site in contiguity to the old Literary and Scientific Institution. The new buildings are placed somewhat to the rear. The architect, Mr. Walter H. Bell, had many difficulties to contend with, but has succeeded by a judicious adaptation of the old portions, and a skilful use of the space at his command, in providing a building which will enable the technical instruction committee to carry on their useful work in an enlarged and more systematic manner. There is an entrance from the Albert Road, but the principal entrance will be in Northbrook Street. In the library an alteration has been made by which, for the future, books may be passed to borrowers over a counter. On the ground floor, a corridor connects the old building with the new. On this floor there are three large rooms to be used for classes in science, woodwork, shorthand and other subjects. The first floor is reached by a handsome staircase in the front part of the building, or by another staircase for general use, situated about the middle of the building. The principal staircase is lighted by a large window glazed with tinted glass, and appropriately decorated with the borough arms in the upper part. The museum will now be located in the rooms which have hitherto been used for the art classes. The school of art, 42 feet by 28 feet, is the chief feature in the new structure; it is a handsome room lighted by three large windows, and well adapted to the purposes for which it is designed. A gallery adjoining, and the art master's room, with lavatories and cloak-rooms conveniently situated, completes the arrangements on the first floor. The caretaker's apartments are situated on the top floor of the Institute. The contractor was Mr. Samuel Elliott, of the Albert Steam Joinery Works, and sub-contracts for the gas and water-fittings were executed by Mr. Ernest Harris and Mr. S. Knight, jun.

THE LATE CHARLES LIDDELL.

MR. CHARLES LIDDELL, the contractor, has just died at the age of eighty-one. He was the son of the Rev. H. G. Liddell, rector of Ensington, Durham, and a brother of the late Dean of Christ Church. Early in life Mr. Liddell was employed under George Stephenson in the construction of the Birmingham and Derby Railway, the Grand Junction, and the line from Rugby to London. With Robert Stephenson he assisted at the making of the Leicester and Swannington, the Syston and Peterborough and other lines. With Mr. L. Gordon, who was then his partner, he was engineer-in-chief of the Newport and Abergavenny, and more than a dozen other railways. He assisted in the same capacity in the construction of the Danube and Black Sea Railway in the Dabrudja—now part of Roumania—and the making of the Novara and Lake Orta Railway in Italy. His latest works have been the prolongation of the Metropolitan Railway to Aylesbury, and the new Manchester, Sheffield and Lincolnshire Railway to Nottingham. As a partner in the firm of R. S. Newall & Co. Mr. Liddell at one time took an active part in the laying of telegraph cables. During the war in the Crimea he laid the cable between Varna and Balaclava. Mr. Liddell was indefatigable from the time he joined Mr. Stephenson till within a week of his death. Whether travelling, standing at a drawing-table in his office, or what he called resting at his home in Sussex, he never ceased working during his waking hours.

BORE-HOLE WELLS.

A PAPER was read by Mr. H. Davey, C.E., on "Bore-hole Wells for Town Water Supply," at the meeting of the British Association. He said that at the Cardiff meeting of the Association he proposed a new system of bore-hole wells for town water supply. Since that time the system has been carried into effect at several places, and he described one of the most important examples of executed work, viz. that of the Netherley pumping-station of the Widnes Waterworks. The subject was dealt with under two heads. In procuring water for town water supply it is the usual and necessary practice to provide duplicate pumping engines, and where two engines are made to pump from the same well the well must be very large,

that it may accommodate two sets of pumps. Such wells are usually 12 feet to 14 feet in diameter. To sink such a well in the ordinary way is a very long and costly undertaking, especially if soft strata be met with, where lining becomes necessary. On the completion of the well it may be necessary to drive adits to increase the water supply. A simple bore-hole is made very cheaply and very expeditiously. Four 30-inch bore-holes can be put down in a very small fraction of the time required to sink a 12-foot well. Instead of making a large well, the author puts down four bore-holes to accommodate the pumps for duplicate pumping engines—a pair of pumps to each engine. The bore-holes being completed, the pumps are lowered into them and coupled-up to the permanent engines. Immediately that is done the water found in the bore-holes can be pumped and supplied to the town. Should it be insufficient, then a small well would be sunk in the dry to the bottom of the bore-hole pumps. The water being kept down by the pumps, the bore-holes at the level of the pumps would be connected to the centre well, and adits driven to collect more water. Should the bore-holes yield sufficient water, it would not be necessary to sink the well. It would be absurd to advocate any particular system of well-sinking as being universally applicable; this system, however, of making wells offers advantages under favourable conditions, but the advisability of its adoption in any particular case must be a matter of judgment with the engineer planning the work. The bore-holes at Netherley, two in number, are sunk in red sandstone rock, and are placed 20 feet apart, each bored to a diameter of 30 inches for a depth of 200 feet, and to a reduced diameter of 18 inches for a further depth of 200 feet and 300 feet respectively, thus making the first hole 400 feet deep and the second one 500 feet deep. On the completion of the boring the water stood 70 to 80 feet from the surface of the ground, when the quantity pumped by the old engine on the same site was $1\frac{1}{4}$ million gallons per day. The main pumps were then lowered into the bore-holes, each pump extending to the bottom of the large part of the hole, 200 feet from the ground-level. In that position the pumps were suspended from a cast-iron bed-plate supported on a concrete foundation formed round the top of the holes, a block of oak being inserted between the head of the pump and the bed-plate. In this suspended position the pumps work without the slightest unsteadiness. The engines were made for the purpose of pumping $2\frac{1}{4}$ million gallons per day, but it was found that, working up to their full capacity of $2\frac{3}{4}$ million gallons, the full

yield of the bore-holes was not reached. On starting the new pumps it was found that when pumping 2½ million gallons per day the water-level was lowered to 100 feet from the surface of the ground.

AMATEUR CONTRACTORS.

A PAPER was read on Monday in the section of Economic Science at the meeting of the British Association at Oxford by Mr. Sidney Webb, on "The Alleged Economic Heresies of the London County Council." He said:—The policy of the London County Council has been intelligently criticised, from the point of view of economic science, mainly under three heads. Instead of "buying its labour in the cheapest market," as it was termed, it has from the first striven to adopt as its standard the trade union rates of wages, and to assert a "moral minimum" of earnings below which it was inexpedient that any London citizen should be allowed to sink. Moreover, not content with proceeding on these lines as regards the workmen whom it directly employs, it has sought throughout to secure that all contractors executing its work should adopt the same principle. Finally, it has endeavoured, wherever possible, to dispense with the middleman *entrepreneur*, and to substitute salaried supervision and management directly under public control. On all three points it has been accused of economic heresy by those who believed themselves to be expressing the conclusions of economic orthodoxy. On all three its action is largely influencing public opinion. It seems desirable, therefore, to set forth precisely the facts and to reconsider the economic position.

After prolonged discussions, repeated at intervals during four years, it has become settled policy (a) to pay in each trade the recognised standard rate of wages, (b) to give no adult male workman less than 6d. per hour and no adult woman less than 18s. per week. The labour policy of the London County Council, whether with regard to skilled or to unskilled labour, may be explained as the deliberate choice of that form of competition which secures the greatest possible efficiency as compared with the form which secures the greatest apparent cheapness. Public offices may be filled in one of two ways. We may on the one hand practically put the places up to auction, taking those candidates who offer to do the work for the lowest wages; or on the other hand we may first fix the emoluments and then pick the best of the candidates coming forward on those terms. The London County Council has

learned by long and painful experience that there is so much difference between competence and incompetence that it does not dream of seeking to save money by taking the candidate who offers his services at the lowest rate. Whether the post to be filled be that of an architect or a carpenter the wage to be paid is first fixed at a rate sufficient to attract the best class of men in the particular occupation. Then the most competent candidate that can be found is chosen. With regard to the lowlier grades of labour a further consideration enters in. The London County Council, responsible as it is for the health of the people of London, declines to use its position as an employer deliberately to degrade that health by paying wages obviously and flagrantly insufficient for maintenance, even if competition drives down rates to that pitch.

So far, indeed, is the Council's action from being economically heretical, as is commonly supposed in West End drawing-rooms, that it is exactly what the instructed economist would nowadays recommend. The economic heretics, in fact, are those who, in flat defiance of Adam Smith, M'Culloch, Mill and Marshall alike, persist in assuming that there is some obligatory "law" that the pressure of competition ought, without interference from man, to be allowed so to act as to degrade the standard of life of the whole community.

Some critics demur to any interference with the freedom of contractors, and denounce as economically heretical the Council's standing order confining the Council's work to such firms as adopt the current standard rates of wages. The very object of industrial competition, they say, is to keep the cost of production down to the lowest possible point, and any interference with the contractor's freedom to do his business in his own way tends to increase that cost. These criticisms confuse cost of production with expenses of production. What the community has at heart is a reduction of the cost of production—that is, of the efforts and sacrifices involved in getting the object desired. It was in order to put a stop to the constant tendency of contractors to nibble at the current standard wages that the London County Council inserted its celebrated fair wages clauses. These clauses, it will be observed, leave open to contractors every chance of profit which comes from reduction of the cost of production. By concentrating the contractor's energy and attention on this point they presumably increase the fierceness of that part of the competitive struggle which promotes the public good. Here, again, the key-note of the Council's policy is, not the

WORKS, ROTHERHAM. Estab. 1854.

abolition of competition, but the shifting of its plane from mere cheapness to that of industrial efficiency. The speeding up of machinery, the better organisation of labour, the greater competency of manager, clerk, or craftsman, are all stimulated and encouraged by the deliberate closing up to the contractor of other means of making profit.

With regard to the Council's determination to dispense wherever possible with the contractor, and execute its works by engaging a staff of workmen under the supervision of its own salaried officers, this has been fiercely attacked as being palpably and obviously opposed to political economy and business experience. Mr. Webb showed by figures that there had been a saving of 2,420*l.* or 12·33 per cent. in the first sixteen operations carried out by the Council without a contractor. It is usually assumed, continued Mr. Webb, by the Council's critics that its policy of eliminating the contractor is an unparalleled innovation unknown outside London. A little knowledge of the action of local governing bodies elsewhere would prevent this mistake. The Corporation of Birmingham is going far beyond the London County Council. When we thus find even the county councils in rural districts giving up the contractor, it ceases to be surprising that the Town Council of Manchester, in the city of Cobden and Bright, now manufactures its own bass-brooms, or even that the ultra-conservative Commissioners of Sewers of the City of London actually set the County Council an example by manufacturing their own carts. The superiority of direct municipal employment under salaried supervision to the system of letting out works to contractors has, in fact, been slowly borne in on the best municipal authorities all over the country by their own administrative experience, quite irrespective of social or political theories. With regard to the integration of processes, Mr. Webb pointed out that within the last twenty years the maxim in large industries was "Never buy from anyone else what you can manufacture for yourself."

He concluded by asking, Why is the elimination of the subsidiary *entrepreneur* more practicable now than it was in the last generation? It would take too long to examine the fundamental causes and conditions of this change in industrial organisation. Most changes in social structure depend, in the long run, upon individual character; possibly there has been a growth in the number of men who can be trusted to work efficiently and honestly as salaried managers instead of for their own personal profit. Possibly, too, as industrial organisation becomes more complex, the advantage to the consumer in

directly controlling the production of every article he requires becomes more apparent. All improvements in social organisation, too—steam, telegraphy, the free use of the printing press, and now the telephone—facilitate the massing of workmen under single generals of industry, able efficiently to control larger and more heterogeneous and more complex industrial armies than could be managed by the captains of the past generation. Finally, as regards the substitution of the collective for the individual management of industry, it is evident that this will have been rendered increasingly practicable by the perfecting of democratic organisation. All these and other influences are but fragmentary suggestions towards the explanation of a change in industry of which the supposed economic heresy of the London County Council is but one out of many manifestations. Formerly the best business management was that which itself managed least. Nowadays the best business management is that which can safely and efficiently administer most. The integration of productive processes under direct control of the consumers may or may not be economic heresy; the business history of England for the past twenty years indicates that it is industrial orthodoxy.

Mr. Edward Atkinson was surprised that Mr. Webb had so completely justified the principle of competition. The County Council had successfully competed with contractors by dispensing with contractors. High wages and cheapness of production was the rule which prevailed in the United States, and was being tried successfully by the Council.

Professor Nicholson observed, with respect to getting rid of the middleman, that this doctrine was not new, but was earnestly supported by Adam Smith as one of his cardinal principles.

General Strachey agreed with what Mr. Webb had said. In days gone by all the railways were constructed by the contractor. Now it was hardly ever done.

Professor Foxwell said that the tendency of the aggregation of many businesses in one hand was by no means universal, and there were striking instances of an opposite character. He was afraid that the irritation at the inevitable inequality in human ability and character and the necessary and justifiable inequality of emolument was one of the most striking and least attractive elements of the modern democracy.

Mr. Bond said there was an impression that the London County Council overpaid their unskilled workmen and underpaid the most highly skilled. The Council might do better than endeavour to master the details of every trade, and he disapproved the rigid adherence to trade unions.

THE TRADE OF CHICAGO.

THE report on the trade of the Consular district of Chicago states that the trade in 1893 shows a falling off compared with that of the preceding year, owing to universal dullness consequent on the financial crisis; but the decrease was not large, and in making the comparison the fact must be taken into consideration that almost every year had shown large and successive increase, and that the year 1892 was an especially prosperous one. The year opened with great activity, and promised at least an average percentage of increase in the volume of business till the panic caused general depression in transactions. The record, based as on previous occasions on a summary compiled by the best authorities, and on such official returns as are available, shows a decrease of about 6.75 per cent. as compared with the record of 1892, the total trade being estimated in round figures at 295,800,000, or 21,300,000. less than in 1892, when the estimate amounted to 317,100,000.

The great prosperity which marked the wholesale trade of Chicago in 1892 lasted during the early months of the following year, until the financial crisis caused dullness in all branches of industry and resulted in the considerable falling off of 9½ per cent. in value of business done compared with the preceding year. The continued demand for many goods consequent on the exhibition in some measure prevented wider stagnation, but country trade was dull, stocks were not replenished in the same degree as usual, and all articles as a rule were cheaper, many of them having never been so low in price as during the last winter.

It is natural that a sensible decrease should be shown in the lumber trade after the greatly-increased consumption in 1892 for the buildings of the exhibition and of those connected with it, and the receipts fell from 2,200,000,000 feet to 1,600,000,000 feet. For the same reason all industries associated with the building trade were comparatively depressed. The iron industry declined, business in structural iron falling off about 50 per cent., some of the largest manufacturing works were temporarily suspended, and the coke iron blast-furnaces were all closed in the autumn.

The manufacturing trade likewise suffered from general depression caused by the financial panic, and it is estimated that there was a decrease in the entire value of production to the extent of nearly 4½ per cent., compared with that of the preceding year. The total value of the product of 1893 is estimated at 117,275,000, the falling-off being mainly due to a

decrease in the packing business, in the wood, brick, and stone and textile fabric industries, and in the production of iron and steel.

The iron and steel industry fell off nearly 2,000,000. in value of production, which was estimated at 12,950,000.

The number of rolling-mills was reduced from six to five, and of foundries from 62 to 53. The output from the mills, which in 1892 was valued at slightly over 5,000,000, fell to 2,887,000, but an increase of about 680,000. brought the output of the foundries to an estimated value of 2,990,000. The large works of the Illinois Steel Company shut down early in the autumn, and the branch works at Joliet were closed nearly the whole of the year. The product of the 82 machinery and malleable iron establishments was estimated at a value of 2,350,000, or about 350,000. more than in 1892. There was a decrease of nearly 10,000 men in the total number of hands employed in the different iron and steel industries, and a reduction of about one-third in the aggregate amount of wages paid, which scarcely reached 2,700,000. Owing to the shorter demand for ore mining has been less active, especially in the older districts, where cost of extraction is greater than at some of the lately discovered mines. The brass and copper industries developed an increased output of 2,637,000. in value, the production in 1893 being estimated at 13,433,000. owing to the unusually large employment of material at the World's Fair, and for the numerous hotels, restaurants and other buildings constructed to meet the requirements of expected visitors, as well as to the greatly increased output from smelting and refining works, which alone was valued at about 8,500,000. The tin, stamped and sheet metalware industries turned out to the approximate value of 1,413,000, or slightly less than in either of the two preceding years. The total number of workers employed in the brass and copper industries was larger by 7,000 than in 1892, amounting to 16,300 hands, and the aggregate amount of wages paid was about two-thirds greater. The whole manufacturing trade in iron and wood, including car and bridge building, elevators and sewing machines, is stated to have amounted to 9,258,000. against 8,950,000. in 1892 and 8,495,000. in 1891.

The panic which cast so depressing an influence over trade in this district during the latter half of the year may be greatly attributed to depreciation in the value of silver, to over-production, and perhaps in some degree to tariff uncertainty. It was not a local panic, but part of a storm-wave which travelled rapidly from east to west, and swept over the whole of

the United States. Even if its origin cannot be traced so far back as the Baring failure, that first cloud in the horizon, when so much stock was thrown on the market here, it was probably accelerated by the great Australian bank failures, which caused a certain feeling of insecurity among communities here, judging from those disasters, as to the stability of their own banks.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

VARIETIES.

WE are requested to announce that the partnership existing between Messrs. R. J. Collier & Henderson has been dissolved. Mr. H. A. Henderson, F.S.I., is carrying on his business as an auctioneer, surveyor and land and estate agent, at 70 Finsbury Pavement, London, E.C., and under his own name only.

THE first piece of turf for the East Glamorgan Railway, a line to connect Barry Dock with the Ogmore Valley, has been cut. The new line will give a direct connection between the coal-fields of the Ogmore Valley and Barry Dock.

IT is stated that Mr. W. Cuthbert Quilter, M.P., has had a steam ferry bridge constructed for the river Doben, Suffolk, near his residence, Bawdsey Manor. The bridge will be a very great convenience to the people of Felixstowe and Woodbridge districts, vehicular communication having hitherto been very difficult. The bridge is constructed of Siemens steel, and is divided into six watertight compartments. It is propelled by

means of chains passing over two segment wheels, motion being given to the segment wheels by a pair of surface condensing engines worked by a return tube boiler. The roadway of the bridge is 12 feet wide and 50 feet long.

THE correspondent of the *Standard* at Vienna says that the Turkish Ministry of Public Works has determined upon the reconstruction of the ancient water conduits of Jerusalem, dating from the age of King Solomon. By this means it would be possible to convey 2,500 cubic metres of water daily to the Holy City. Of this it is proposed to give 1,000 metres away free of charge to the poor of Jerusalem, the distribution to take place at the mosque of Omar, the Holy Sepulchre and other places frequented by pilgrims. The new conduits are to be joined to the ancient aqueducts of Aroba, and are to be carried through a tunnel 3,570 metres in length. The total outlay in connection with these works is estimated at 2,000,000 francs.

THE application of the Bath Town Council for powers to borrow 30,000*l.* for certain improvements to the Grand Pump Room, Bath, has just been heard. Mr. Austin King, who appeared for the Corporation, said that the proposed extension included the provision of another concert-room, a coffee-room and ladies' parlour, with other improvements, to make a pleasant lounge. Large sums of money, he said, had been expended in building new baths lately, and the bathing establishment was now very complete.

THE Worcester City Council propose to borrow 850*l.* to purchase a site on which to erect a new isolation hospital for infectious diseases.

SCARBOROUGH CORPORATION propose to borrow 70,000*l.* for the construction of a new marine drive and sea wall round the Castle Hill.

THE Town Council at Southend-on-Sea have applied to the Local Government Board for permission to borrow 25,000*l.* for works of sewerage and sewage disposal, 4,200*l.* for the erection of municipal buildings, and 400*l.* for the construction of underground conveniences.

THE final meeting of shareholders of the Accrington Gas and Waterworks Company, whose extensive undertaking has been sold to the Corporation and four local boards surrounding, has just been held. In addition to declaring the customary dividends of 10 and 8 per cent., the meeting decided to distribute undivided profits amongst the shareholders equal to the

extra dividend of 10 and 8 per cent. on A and B stock. There is a remaining sum of 5,000*l.* received from local authorities as compensation, and a committee was appointed to confer with the directors as to how the money should be divided.

AT Glasgow some interesting experiments are being made in the relaying of Buchanan Street. For many years wood has been the pavement used for this thoroughfare, and in order to test the particular timber best suited for the traffic, four different kinds of wood are now being used in the relaying of the street. These are Jarrahdale, Karri wood, Kauri pine and carbolised pitch-pine. In addition to these, however, a new cork pavement is also to be experimented with. Some time ago brick paving was tried, but given up as a failure.

THE *Liverpool Courier* says:—The preparations for the forthcoming Autumn Exhibition of pictures at the Walker Art Gallery are making rapid progress, and those who are in a position to know confidently express the opinion that the show will be one of the best in recent years. The Artists' Club dinner to the gentlemen engaged in selecting and hanging the pictures has been arranged for the evening of Tuesday, 28th inst., and the Corporation banquet will take place on the 30th.

AT the meeting of the proprietors of the Liverpool Gas Company it was reported that the year's working showed a surplus of 107,790*l.* The coal strike had entailed a large increase in the expenditure upon coal. In view, however, of their present coal contracts, the directors felt justified in reducing the price of gas from 3*s.* 4*d.* to 3*s.* per 1,000 cubic feet.

AT the meeting of the Edinburgh Dean of Guild Court a warrant was granted for the construction of a bridge across the Water of Leith at Bell Place, Glenogle Road.

THE Tunstall Local Board of Health propose to borrow 1,500*l.* for the extension of the technical schools. The additions contemplated are estimated to cost 2,300*l.*

THE *Birmingham Post* says:—It was intended to solicit from American visitors donations for a new east window for Stratford-on-Avon parish church, the cost being estimated at 600*l.* A wealthy English gentleman, Mr. William Law, of Littleborough, near Manchester, has now come forward and offered to present to the church an English window in place of the one proposed, and it is believed that his offer will be accepted.

TRADE NOTES.

A NEW large turret Cambridge full four-quarter chime clock, with five large bells and four automaton figures taken from Sir Walter Scott's "Ivanhoe," and representing King Richard, Friar Tuck, Robin Hood, and Gurth the Swine Herd, has been fixed in the new Arcade, Oldham, Lancs., just erected for Mr. J. Hilton, wholesale clothier, of Curzon Street, Oldham, by Messrs. Wild, Collins & Wild, architects, of Clegg Street, Oldham. The arcade connects two of the principal streets of this busy town, and at one of the entrances is placed a large 6-foot illuminated dial with ornamental corners designed by the architect. The clock is from the firm of Messrs. W. Potts & Sons, 13 Guildford Street, Leeds, and 22 Collingwood Street, Newcastle-on-Tyne, who are well known for this class of work, and they have introduced all the latest improvements of Lord Grimthorpe, the greatest authority on clocks and bells. Besides being an attraction, it will also be very useful as a good time-keeper.

WE are informed by Messrs. W. F. Dennis & Co., of Billiter Street, E.C., that they have been appointed sole agents in Great Britain and Ireland for the Antwerp Telephone and Electrical Works (Société Anonyme), Antwerp, manufacturers of telephones and other electrical appliances, which they have for some years past made a specialty of, for the English market (home and export).

ELECTRICAL.

WE notice that the Edison and Swan United Electric Light Company, Limited, are removing their head offices from 100 Victoria Street, S.W., to new premises, the Ediswan Buildings, 5 and 37 Queen Street, Cannon Street, E.C., where they will carry on business on and after August 27.

AT Worcester the mayor, Mr. G. H. Williamson, will open the new electric-light works on October 11.

AT Wolverhampton the Corporation scheme for illuminating central area of Wolverhampton with the electric light is nearing completion, the lines having been laid beneath the footways, and the generating station will be finished shortly. The principal Corporation buildings which will be lighted on

the new principle will be the Town Hall, Market Hall, Free Library, Art Gallery and School of Art, and out of the twenty-two competitors Messrs. Fletcher & Hurst, of Burnley, have secured the contract for putting the necessary wires and the selected fittings into those buildings. The amount of the tender, which was the lowest, was 609*l.* 11*s.* The tender for the pendants and other fittings has not yet been agreed upon.

THE *Irish Times* says:—It will be recollected that last year the Bill promoted by the Dublin Southern Tramways Company for applying electricity to the working of their cars on the overhead system between Haddington Road, Kingstown and Dalkey received the Royal assent. Since then the company, who have their headquarters in Bristol, have been making the necessary arrangements for commencing operations, and we understand that these have been so far advanced that the contracts for the electric installation have actually been placed.

GREAT improvements are being effected at Arundel Castle for the Duke of Norfolk. The work of rebuilding the castle is steadily proceeding, and the new road and bridge are rapidly approaching completion. When the electric light installation is completed, it will be one of the most important private installations in the kingdom. The building connected with the electric lighting and general arrangements of the plant have been carried out according to the designs of Mr. A. F. Phillips, C.E., of St. Albans, and of 31 Great George Street, Westminster. A fire-reserve has also been constructed under the designs of Mr. A. F. Phillips, embodying all the principles which Sir E. M. Shaw thought advisable.

HYDRAULIC POWER SUPPLY IN SYDNEY.*

I PROPOSE to consider briefly in the first place the remarkable progress and development that has been made in hydraulic power supply on the co-operative system during the last few years. The first meeting of this Association at which I had the honour of being present was in September 1889, on the occasion of Mr. Selfe's very able paper on "The Operation of Power Companies and Power Transmission by Compressed

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

Air." On that occasion the system of power transmission by compressed air had a worthy champion in Mr. Selfe. At a later stage I may have to refer to statements then made in reference to the cost of hydraulic power supply in Sydney. Public power supply on the high-pressure hydraulic system was successfully established in Hull in 1875, on a comparatively small scale, the installation consisting of two pairs of pumping engines of 60 horse-power each, two Lancashire boilers 22 feet 6 inches by 6 feet 6 inches diameter, one accumulator with 18 inch ram by 20 feet stroke, with storage and filtering tanks complete. Additions have since been made adding to the output capacity of this station. The works have been in continuous and successful operation up to the present time. Then we have the London Company inaugurated in 1882, with works in operation in 1884, delivering 218,000 gallons per week, to 96 machines. In the London Company's report for the year ending December 31, 1893, we have the enormous development in their operations represented by a total output of over 7,000,000 gallons per week, supplied to work a total of 2,025 machines, producing a revenue of 51,445 $\frac{1}{2}$ per annum. Liverpool was the next city to adopt the system in 1886, Melbourne in 1888, Sydney in 1890. The Birmingham Corporation recently commenced to supply power on their own account; works have also been erected in Manchester and Glasgow by the respective corporations. The Melbourne Company commenced to supply power in July 1889, with about 12 machines connected. Now they are supplying power to 413 machines consuming 1,500,000 gallons per week, with a total length of 18 miles of mains in use. The Sydney Hydraulic Power Company commenced to supply power in January 1891 to 8 machines, and now they are supplying power to over 200 machines. The steady growth in the company's operations and its appreciation by the public is evidenced by the following particulars:—Water delivered to mains—December 1891, 240,000 gallons per week; December 1892, 570,000 gallons per week; December 1893, 721,000 gallons per week. The output at date is 740,000 gallons per week, showing a continued steady increase.

The company's central pumping station, situated in Pier Street, Darling Harbour, is a building containing engine-room, boiler-house, accumulator tower, coal store and commodious yard space for the storage of pipes, &c. The engine-house contains three sets of high-pressure expansive steam-pumping engines of "Armstrong's" horizontal type. Two pairs of the engines have steam cylinders 24 inches diameter by 30-inch stroke, and one pair

with cylinders 16 inches diameter by 24-inch stroke. At a working pressure of 100 lbs. per square inch at the boilers, each pair of the large engines is capable of delivering 475 gallons per minute from the pump at a pressure of 750 lbs. per square inch when running at 50 revolutions per minute. The smaller set of engines, 16-inch by 24-inch stroke, is equal to delivering 200 gallons per minute under the same conditions when running at 60 revolutions per minute, the piston speed being 250 and 240 feet per minute respectively, the three engines being equal to a total output of 1,200 gallons per minute. Each set of engines is complete in itself, with two high-pressure steam cylinders and two double-acting force-pumps fixed on a massive cast-iron bed-plate. The cranks are shrunk and keyed on to a shaft common to both sides of the engine; the flywheels for the 24-inch cylinder engines are 11 feet in diameter, weighing each 95 cwt., and for the 16-inch cylinder engine 9 feet diameter, and weighs 70 cwt. The steam cylinders have a main slide and also expansion slide working on the back of same, arranged to cut off at any point between three-tenths of the piston-stroke and the cut-off of the main valve. The expansion-valves are capable of being adjusted while the engines are running. The force-pump cylinders of the 24-inch cylinder-engines are 7 $\frac{1}{2}$ inches diameter, and fitted with solid gunmetal rams 7 $\frac{1}{2}$ inches diameter in piston part and 5 $\frac{5}{8}$ inches in body part; for the 16-inch engines the rams are 5 $\frac{1}{4}$ inches diameter in piston and 3 $\frac{3}{4}$ inches diameter in body part. The suction-valves are 7 inches diameter and the retention-valves 6 inches diameter for the 24-inch engines and 5 inches and 4 inches respectively for the smaller set of engines. The water delivered from the main pumps passes into the accumulators. The rams are 20 inches in diameter and have a stroke of 22 feet; they are each loaded with 100 tons of ballast (Nepean gravel) contained in a wrought-iron cylindrical casing suspended from a crosshead on the top of ram. The area of each ram is 314 square inches, and the pressure being 750 lbs. on the square inch, the total load is 235,500 lbs., or nearly 105 tons, the extra 5 tons being supplied by the weight of ram and casing. One of the accumulators is loaded a little heavier than the other, so that they rise successively, the more heavily weighted, being the controlling accumulator, actuates a throttle valve on the main steam pipes. If the engines supply more water than is wanted the lighter of the two rams first rises as far as it can go, the other ram then rises, and when it has reached nearly the limit of its stroke, shuts off the steam and slows down, or stops the engines automatically; although one accumulator is always in

advance of the other the difference of load is so small that both move at the same time ; the result is that the pressure is maintained in the mains with very great regularity. In the arrangement of the steam, feed and hydraulic pipes at the works a thorough system of duplication has been carried out. From the boilers to the pumping engines two distinct lines of steam pipes are provided, so that any boiler can be isolated for examination or repairs, and any section of the system of steam pipes can be closed if necessary for remaking joints or other repairs without any inconvenience whatever ; the same system of duplication has been carried out in the arrangement of feed pipes. The pressure pipes from the pumps to accumulators have been arranged in a similar manner ; two separate pipes are provided with stop-valves arranged so that any engine can be shut off without any interruption to the supply ; should a pressure pipe break the section can be isolated at once, the water being sent through the duplicate main, and repairs effected without stoppage. This matter of duplication has been carefully planned and carried out in order to minimise the risk of interruption of supply, a most important consideration where hundreds of elevators and hoists rely on one source for their motive power.

(To be continued.)

NEW CATALOGUES.

HOBBS, HART & CO., Limited, have issued a new edition of the safe and strong room door section of their illustrated price list. It contains the information which is required on the subject in the most precise form. With a firm of the kind the briefest statement is sufficient, for their works are a better recommendation than can be given by words. There are accurate drawings of the various classes of safes and safe doors which are being manufactured by the firm and corresponding to those which have gained a reputation for them. That their productions have been employed for the royal gold and silver plate-rooms and jewel-room in the Bank of England and in many of the most important banks of London and the provinces, is the best testimony to the value of the construction as an unconquerable protection. The examples, which are illustrated, speak well for the skill and energy of the present management, and we have no doubt the very large outlay will have an adequate return. The list of safes and doors is to be followed by a revised lock list.

ORNAMENTATION IN GLASS.

MESSRS. JONES & FIRMAN have recently revived the old-fashioned "brilliant" cutting, but their latest and most highly decorative form of ornamentation is what is known as the French or shaded embossing.

Quite lately we visited the works of Messrs. Jones and Firmin, Blackfriars Road, London, and saw some very rich panels produced by this new process, which will prove a favourite method of decoration for some time, as it is soft and delicate in tone, light in appearance, and in the hands of experienced manufacturers, such as the firm in question, is capable of producing most beautiful effects. We also saw some glass tablets for wall decoration, the subject being painted on the back of the glass before the silvering is done. This has a far better effect than painting on the face of the glass, and it is stated that mirrors made in this style can be produced at a less cost than tiles.

There are few industries in which so many changes and improvements have been effected as those which deal with the utilisation of glass for decorative purposes and for advertising.

BURSTING OF WATER-MAINS.

CONSIDERABLE commotion and damage was occasioned in Birmingham by the bursting of water-mains in three districts. Water was seen issuing from the roadway at the junction of Liverpool Road and High Street, and the volume increased rapidly until it attained sufficient force to tear up the macadam and the concrete bed and stone setting of the tramway, traffic upon which had to be suspended. Information of the occurrence was telephoned to the officials of the Staffordshire Potteries Waterworks Company, but before the water could be turned off at the reservoir Liverpool Road was flooded for a distance of 500 yards, and the cellars of the houses for at least

a hundred yards on each side of the breakage were completely filled with water. The manual engine of the Stoke fire brigade was made use of for the purpose of pumping the water from the cellars, and men were at work throughout the night and next morning in replacing the fractured main pipe and restoring the roadway and tramway. Some time after the burst in Liverpool Road there was another break in the main at the top of the Honeywall, Penkhull, and the flood of water issuing from the opening flowed down the hill with such force as to cut up the roadway and cause much damage to the pavement and channelling in several places. There was also an extensive bursting of the main at Trent Vale, where it passes over the bridge spanning the Newcastle branch of the Trent and Mersey Canal. Torrents of water swept down the road in the direction of Trentham for several hundred yards, and accumulating in a hollow at the foot of the incline caused a flood several feet deep, and rendered the road impassable for some time. The main to which these accidents occurred is a comparatively new one, and carries water from the company's new works at Hatton to the Potteries. It is understood that the company have ordered an investigation to be made as to the cause of the breakages.

BELGIAN v. ENGLISH IRON JOISTS.

When addressing a meeting at Brooklands, Mr. Thomas Morris, of the Pearson and Knowles Iron Company, Warrington, referred to his recent investigations into the condition of the Belgian iron trade. He said that he had recently made a journey to Belgium to ascertain on the spot how it was they could make so cheaply this building and construction material which was imported so largely into this country for building purposes. When he told them that in the Law Courts, London, there were used 11,000 tons of Belgian iron, and in the Hôtel Métropole 10,000 tons, they would have some idea, applying it to the whole of England, of the enormous quantity of iron that came from Belgium. It had frequently puzzled him how they could beat us on our own ground, and he determined to ascertain the reason. He fortunately met in Antwerp a gentleman who was agent for a Sheffield firm, who kindly volunteered to show him all that could be seen and give him every information possible. He ascertained that the price of the pig-iron at the works before it was made into those sections which architects were so fond of putting into our large buildings was 35 francs,

but that the Belgians had put a duty of 6 francs on French pig-iron. The Belgians cried out because the French were sending pig-iron into Belgium. In addition there were 6 francs per ton carriage, in all 50 francs, or 2½ per ton. He (the speaker) said they got pig-iron in England as cheap as that, and thought it might be in the lower price of coal. The price, however, was as much as with us, and the price paid for puddling was the same. When he got to the works he found that the puddlers who started with this pig-iron were working for a quarter the price we were paying in England to-day, and so on through every department it was a third or fourth less. These men worked almost continuously for miserable wages. They knew nothing of a Sabbath or seventh day. In England the trades union leaders were crying out for an eight hours' day, and while he did not desire that in England they should work longer than they did, some effort ought to be made whereby these men should have one day in seven and something akin to the hours they had here. If they could not afford to pay more wages then they need not do it, but cut off those long hours, compel English railway companies to carry merchandise at the same rate as they did in Belgium, and he did not think we should see one ton of building sections in England where now they saw thousands. He thought the trades union leaders and our working men should move to obtain shorter hours on the Continent, and then with fair rates of carriage and fair competition there would be more work and people would be happier all round. At the same time he wished it to be known in Belgium that what he saw there was sufficient to shame any man of common sense or any man who had capital to spend where labour was employed.

A MANX ELECTRIC TRAMWAY.

An electric tramway constructed by the Isle of Man Electric Tramway Company (Limited), and running between Douglas and Laxey, has been formally opened from end to end. It was completed and opened as far as Groudle Glen, half the full distance, last summer. The traffic, especially since the whole of the line has been opened, is very large, far exceeding the expectations of the promoters, as it affords a very pleasant excursion for the many summer visitors to the island. The tramroad is seven miles in length, with a double line all the distance. It is a surface line, following, for the most part, the contours of the hilly country through which it passes, but at

the Douglas end there is a cutting along the face of the cliff, this portion of the road being protected seaward by a massive cement-concreted wall. At other portions of the line there are some long gradients, the steepest being 1 in 24. The line is made of the ordinary steel rails laid on transverse sleepers. The speed is, by Act of Tynwald (the Manx Parliament), limited to eight miles an hour. The cost of the line, including the plant, rolling-stock and electrical machinery, is about 9,000*l.* a mile. Each train consists of one motor and one trailing car, the two vehicles being together capable of seating eighty-two persons. The electric current is generated at two stations—one at Douglas and the other at the Laxey terminus. At the Douglas end there are three steam-engines and three boilers, each engine driving a fifty kilowatt dynamo of the Manchester type. There is also a large fixed accumulator storage station about halfway along the line. The current generated by the dynamos is conveyed by copper conductors supported by steel poles erected along the line. Two uprights fixed on each motor car carry a horizontal copper collecting bar, which conveys the current from the conductors to two 30 horse-power motors fixed underneath each car. These motors are geared to the axle of the driving rails. The return current passes through the rails, which are connected by a copper strip at each joint. The whole of the electrical plant and machinery has been designed by Dr. E. Hopkinson, the contractors for the work being Messrs. Mather & Platt, of the Salford Iron Works, and the engineer by whom the tramroad was constructed Mr. Frederick Saunderson, of Douglas. The line has been inspected by Colonel Rich and Major Cardew, the Government inspectors, who passed over in a trial car, and who expressed their entire satisfaction with it in every respect.

THE CHANCELOT FLOUR MILLS, EDINBURGH.

THE pile of buildings erected by the Scottish Co-operative Wholesale Society, Limited, at the northern boundary of Edinburgh has been opened. The buildings are to be known as the Chancelot Roller Flour Mills. It appears, says the *Scotsman*, that the distributive co-operative societies federated with the Wholesale Society purchase about 180,000 bags of home millers' flour each year; and in these circumstances the directors in 1891 resolved to add flour milling to their already numerous branches of manufacturing industry.

Ground at Chancelot, extending to over two acres, was taken from Colonel Clark Rattray, and the memorial-stone was laid by Mr. W. Maxwell, the president, on August 6, 1892. The progress of the building has been watched with considerable interest by thousands who have no monetary stake in it. The Chancelot Mills now form one of the most conspicuous objects on the northern boundary of the city looking towards Leith; and it is a circumstance on which the directors deserve to be congratulated, that they have not only seen to it that the mills are stoutly built and efficient for their work, but that they have been enlightened enough to permit their architect to impart to the front elevation a distinctly ornamental architectural character. With their imposing mass, prominent clock tower and other decorative features, the mills are among the most important industrial buildings that have been erected in Edinburgh for many years.

The pile has been built and equipped after a careful inspection and consideration of the most modern flour mills in England and Scotland. The frontage to Dalmeny Road has a length of 328 feet. It is of Classic design, boldly planned, the line being broken up by four bays effectively pilastered and showing other simple forms of Classic ornament. These bays are surmounted by domical roofs crowned by iron crests. The central tower, 42 feet square at the base, rises to a height of 185 feet. It shows at the angles clusters of pilasters and pinnacles; the four clock faces are placed in a series of moulded dormers surmounted by a sheaf of wheat, and crowning all is the high-pitched conical roof terminating in a platform surrounded by a massive iron crest, into which are worked the monogram of the Society and the Scottish thistle. A capital feature of the elevation is an open balustrade, which is carried right round the wall-head of the mill save where the bays and towers intervene, and a similar balustrade adorns the wall-head of the plainer warehouse block behind. Immediately to the east of the tower the engine-house is projected beyond the line of the general building. This, with rustic ashlar-work similar to the base of the whole mill, circular-headed windows, moulded cornice and balustrade, is also an effective part of the design. The whole of the buildings are built of stone; the walls are 2 feet 6 inches thick at the base, and internally are plastered with Portland cement and Keene's cement, which give to them a hard white surface.

The mill has in the meantime been fitted up with plant capable of turning out 25 sacks per hour, and there is provision for increasing the output by other 15 sacks with the same

engine power. The working week for the machinery will be one of 144 hours, engines and machinery going night and day except on Sundays. The mill is entirely fitted up with Symon's roller plant, which in their report to their constituents the deputation which visited other mills say had been recommended to them as a modern and efficient system. Mechanically it seems exceedingly perfect, for so complete is the mechanism for receiving, lifting, cleaning, storing and distributing the wheat, and milling, separating and sacking the flour, that it seems something like forty men only will be required to keep the whole mill running. Looking at the buildings from Dalmeny Road, that portion to the east of the tower is the mill proper: in the tower are situated the wheat cleaners; to the west of the tower is the silo-house; and in the westmost bay a number of workshops of various kinds chiefly associated with the repairing of sacks, &c. This front building is of five storeys, and is 65 feet in height to the wall-head. The different floors vary from 14 feet 6 inches to 12 feet 6 inches in height. To the north of the mill, and separated from it by a courtyard 40 feet in width, is a large range of warehouses, six storeys in height, and to the north of the silo-house are workshops for mechanics, the boiler-house and chimney stack, which rises in shape like a Doric column with ornamental gilled top to a height of 215 feet. Beyond that is the North British siding, and on ground on the north side of the railway, over which is thrown an iron bridge, is a range of stables and cart sheds. The Caledonian Railway has acquired ground to the east of the mill, in connection with their new Leith line, and they will form a siding in the court between the mill and the warehouses, so that there will be ample railway facilities for receiving grain and sending away the manufactured flour. A few notes may be given to show how complete in all respects are the labour-saving appliances at this mill. The wheat coming by railway is poured from the waggon into a tip, and carried along a subway on an endless belt to a hopper in the basement of the tower. The belt can deal with 50 tons an hour. From the hopper the wheat is raised by elevators to the top of the tower, where it is roughly brushed by machinery and distributed, by means of spouts and travelling-bands, into a series of fifty-four wooden silos, each 8 feet square and about 60 feet in depth, where it is stored. The silos have hopper bottoms, and when the mill is running these discharge the wheat by spouts upon moving bands and screws, which carry it to the cleaners in the tower, whence it passes to the mill and goes through on the several floors all the various processes of rolling

and milling. The flour is carried across an iron gangway connecting the mill and the warehouse on travelling bands, and is mechanically sacked and pressed by an ingenious American contrivance. Not a hand touches it from the moment the wheat passes into the mill until it is sent out sacked and ready for use. At different stages the wheat and flour are automatically weighed, so that the quantities of grain used and flour delivered can be precisely ascertained; and at one point the flour passes through a machine with magnets, whose object is to attract any metallic particles which accidentally may have gone along with it. In the warehouse, each floor of which is carried on seventy-two cast-iron beams, there is storage for 45,000 to 50,000 sacks. Approved tackle-lifts for delivering the sacks either into the railway waggons or into carts are placed all round this part of the building. The main cart entrance is in the basement of the tower.

The engine-house, situated as already stated on the east of the tower, is 61 feet by 55 feet by 27 feet in height, and the taste seen outside is also exhibited in the decoration of this apartment, as the only one in the mill suitable for such treatment. The deep spaces of the iron girders carrying the floor above have been effectively dealt with, and form for the engine-house a beautifully panelled ceiling done in cordelova; there are a series of iron-supporting pillars with Corinthian capitals; the walls are pilastered at various points; there is a decorative cornice and a handsome dado, the latter in cordelova, with raised wheatsheaf and floral devices. The floor is laid with black and white tiles, and the windows are filled with stained-glass figures associated with the agricultural industry.

The engines, which are of a powerful description, were constructed by D. Stewart & Co., Limited, Glasgow. They are of the triple-expansion, horizontal, tandem, Corliss, condensing type. They have one high-pressure cylinder 15 inches in diameter, one intermediate cylinder 24 inches in diameter, and two low-pressure cylinders 28 inches in diameter, each cylinder having a 4-foot stroke. Power is transmitted by a rope pulley 20 feet in diameter, grooved for eighteen $1\frac{3}{4}$ -inch ropes. The engines can develop 600 horse-power, with a consumption of 11 lbs. of steam per horse-power per hour. In the same engine-room is a small compound engine of similar construction for driving the dynamos of the electric light installation, the shaft being so arranged that the mill engine may be called into requisition for this purpose if it should be required. Steam is supplied by two horizontal boilers 8 feet in diameter by 30 feet in length, constructed by Messrs. Penman & Co.,

Glasgow. They work up to a pressure of 160 lbs. per square inch. The feed water is heated by means of a fuel economiser, and the condensing water will circulate between the boilers and a series of large brick-built cooling ponds placed at the west end of the grounds.

The dynamos are two compound self-regulators of 30 units each, made by Mavor & Coulson, Glasgow, and fitted with Sayer's patent non-sparking armature. Each machine is capable of lighting up the whole mill, the installation of which consists of 500 incandescent lamps of 16 candle-power and eight outdoor arc lamps. The wiring throughout the mill is on the concentric wire system. All the branch circuits are of a uniform sectional area, distributing from a single fuse box in each section. The main distributing circuit is led from the switch-board to these fuse boxes, thereby reducing the chance of faults to a minimum, as there are no joints off the main cables. The switch-board is set between the two dynamos, and has twenty-four branch switches for the various circuits.

The arrangements for guarding against and dealing with outbreaks of fire are of a complete description. The rope-race immediately to the east of the tower forms a fireproof buffer-chamber 7 feet 6 inches across between the mill and the tower; while the tower itself constitutes a similar fireproof block against fire from the silo-house. In one of the floors of the mill there is an ingenious cyclonic machine for gathering from the spouts the fine flour dust by which explosions are often caused; and in addition to a wide distribution of fire hydrants and a fireproof stone stair placed in the tower which forms an architectural feature at the back of the buildings, the mill has been fitted with Grinnell's automatic sprinkler, which consists of a large series of pipes with 770 sprinklers closed with solder. If fire should occur the solder melts whenever the temperature is raised to 155 deg. Fahrenheit and the water pours through the sprinklers upon the flames. For sprinkler and hydrant purposes there is a large tank on the top of the tower capable of containing 30,000 gallons of water. Great pressure is thus got on the fire apparatus.

The total cost of this fine pile of buildings and their equipment will be about 100,000l. The designs were by the late Mr. James Simpson, burgh assessor and architect, Leith, and since his death the work has been carried out by his son, Mr. George Simpson, who also succeeded his father in his civic appointment. The whole of the masonry was built without the intervention of contractors, and on an average between 200 and 300 masons and labourers were employed upon it.

FORESTRY IN GREAT BRITAIN.

AN address was delivered at the opening of the Biological Section at the meeting of the British Association at Oxford by Professor Bayley Balfour on "Forestry." He said he had followed the lead of those of his predecessors in this chair, who had used the opportunity to discuss a practical subject. Forestry was a branch of applied science, to which in this country but little attention had been given by any class of the community. By scientific men it had practically been ignored. Yet it was a division of rural economy which ought to be the basis of a large national industry. There were no intrinsic circumstances in the country to prevent their growing trees as a profitable crop for timber as well as their neighbours. Nowhere in the world, probably, were to be found finer specimens of tree growth. But the growing of trees for effect and in plantations was a very different matter from their cultivation on scientific principles for the purpose of yielding profitable crops. It was the latter aspect—the sylvicultural aspect—in the science of forestry which had hitherto been neglected in this country. There were two aspects from which forests were of importance to a country—firstly, as a source of timber and fuel, and secondly, on account of their hygienic and climatic influences. Dealing more particularly with the former aspect, the Professor remarked that while there were no means available through which to estimate the annual output of timber from their plantations, indirectly they could gauge the insufficiency of their woodlands to supply the timber necessities of the country by reference to the returns showing the amount and value of forest produce annually imported. This had been steadily increasing, until in 1893 its value exceeded eighteen millions sterling. No one, of course, would suggest that in the limited and densely-populated area of Great Britain timber trees of kinds suiting the climate could be grown sufficient to supply all their demands. But few would venture to deny that they could do very much better for themselves than they did, and that their labour payments abroad might be materially reduced. It was admitted that well-grown home timber was, of its kind, equal to, if not superior in quality to that which was imported. It was surely then legitimate to expect that a large supply of well-grown timber would enable them to hold the market to a much larger extent than was at present the case, and that they might be very much less dependent than they were upon the surplus timber of other nations. The Professor went on to show that the importance of this was increased by

the fact that there was abundant evidence forthcoming to indicate that the present rate of timber consumption of the world was in excess of the present reproduction in the forests of the great timber-supplying countries, and that with the persistence of existing conditions they would appear to be within measurable distance of a timber famine. The acreage of wooded land in Great Britain and Ireland was only 4 per cent. of its total area—a smaller proportion so covered than any other European country. Denmark had 5 per cent., France 15, Norway and Germany 25, Austria-Hungary 30, whilst in Sweden the amount was over 40 per cent. But although there was so little land under wood in Britain and Ireland, there were thousands of acres unsuited for any other crop, and these it was desirable to have planted. How to have this accomplished and how to secure that woodlands already existing should be tended so as to produce a maximum result giving a profitable return were the problems they wished to see solved. Dealing with certain practical difficulties in the way of an extension of planting, Professor Balfour remarked that forestry was handicapped as compared with agriculture, by the fact that the crop could not be reaped within the year. It was this planting for posterity that made demands upon the landowner to which he was unequal. But in this connection the Professor argued that, scientifically worked, a forest area on suitable land, of which there was such abundance in Britain, should be capable of yielding an annual net revenue as regular as that obtainable by any other form of soil cultivation. The latter and larger half of Professor Balfour's address was devoted to the consideration of practical suggestions for bringing forestry in Britain more in line with that of other nations. The State, he said, ought to treat the forest areas now in its possession in a reasonable and scientific manner, instead of leaving them as objects for the finger of scientific scorn. The creation of some experimental teaching stations in State forests was one of the essentials for forestry in Britain. He would go further, and say that the area of State ownership should be increased to the extent of the establishment of forestry stations of an acreage sufficient to allow of a satisfactory rotation—for instance, in the North of England and in Scotland. There had been, as they were aware, proposals for the afforestation of some of the three million and more acres of waste land in the Highlands of Scotland capable of growing timber, and they awaited with some interest the report of the Deer Forest Commission which had taken evidence on the subject. If, as had been suggested might be

possible, afforestation was attempted through any system of State-aided planting, an opportunity would be afforded for securing what would be of much advantage to the country. Remarking that it was through education alone that they could arrive at improved forestry, Professor Balfour discussed the scanty provisions already made in the country for imparting teaching in silviculture, and made suggestions as to how that could be extended and improved, especially by the co-operation of the Board of Agriculture and the County Councils, with, it might be, aid from private benefactors. He believed the importance of forestry as a national question must sooner or later be recognised. Its elements were complex, and it touched large social problems; but the whole question ultimately resolved itself into one of the application of science. To botanists they must look, in the first instance, for the propagation of the scientific knowledge upon which this large industry must rest. They must be the apostles of forestry, and forestry in turn would react upon their treatment of botany. Botany could not thrive in a purely retrospective atmosphere. It could only live by keeping in touch with the national life, and the path by which it might at the present time best do this was that offered by forestry.

FEUS AND BUILDING LEASES IN SCOTLAND.

THE report of the select committee appointed to inquire into the subject of feus and building leases in Scotland has prepared its report, which has been published as a parliamentary paper. The report is dated July 26, and extends to fourteen pages, and appended to it are the proceedings of the committee. The matter first dealt with is "commutation of casualties of superiority." After describing the law and practice in the matter of the exaction of casualties by superiors, the report says:—"There appears to be now a prevalent consensus of opinion, both professional and lay, that it would be desirable to put an end to such payments as relief duty and composition, for reasons of general policy and public interest, and the question comes to be, should this be enforced by legislation, and if so, upon what terms?" From what has been already said, it is plain that both these casualties are well-known parts or adjuncts of the estate of superiority, and that Parliament could not be asked to abolish them without providing in some form a fair equivalent

THE MOST PERFECT AND RELIABLE SYSTEM OF

VENTILATION AND HEATING FOR SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns. Estimates on Shortest Notice. Low Working Expenses.

to the superior. The purchase of superiorities has long been a favourite form of investment in Scotland, especially for trustees in charitable, ecclesiastical and other trusts of prolonged endurance, and in the price given for them regard has been had not only to the annual feu-duties, but also to the casualties. In some cases where the feu-duty has been nominal or little more than nominal, the casualties have been of large amount and have thus constituted the only valuable part of the estate of superiority purchased. The first point to be considered is whether the abolition of the casualties in question should be optional either to the superior or to the vassal, or to both, or whether it should be compulsory, and the preponderance of opinion among the witnesses examined is to the effect that it should be compulsory. The Act of 1874 has certainly failed to bring about commutation upon any considerable scale, and even if the option of claiming commutation was extended to the superior, it is very doubtful whether this would greatly enlarge the number of cases in which the casualties would be commuted. The committee concur in the view that it would be desirable to provide by legislation that all existing casualties should be compulsorily commuted, and that even the stipulation for casualties of fixed amounts becoming due at specified periods, allowed by the Act of 1874, should be prohibited for the future, the sole payments to be hereafter stipulated to be made by the vassal to the superior in respect of the feu, to take the form of an annual feu-duty, provided always that a just basis for the commutation could be arrived at. Upon this essential point, however, as well as upon the question at what time the commutation should be enforced, a difference of opinion exists among the members of the committee. A minority of the committee think that commutation should be compulsory and immediate, and that the basis of commutation of casualties becoming due on the death of the last-entered vassal should be the capital value of one casualty (in addition to any casualty which may have already become due), convertible into a permanent annuity or addition to the feu-duty at the rate of 3 per cent. upon the capital value of the casualty in the ordinary case, and that where the casualties are stipulated to be paid on each sale or transfer of the property the rate of conversion should be somewhat higher, say 4 per cent. While these are the views entertained by a minority of the committee in regard to the commutation of casualties, a majority feel themselves unable to recommend that immediate compulsory commutation should be enforced by legislation, partly upon the ground

that many vassals would object to having an addition made at once to their feu-duties by way of commutation of a charge which might not fall upon them for many years, and which possibly might never do so, and partly because it is, in their opinion, impossible to arrive at a basis of present commutation which could be fairly applied to all cases. It appears to a majority of the committee that the best course would be to provide that compulsory commutation should not be enforced until a casualty of composition should become due, and they would recommend that it should then be in the option of the vassal either to pay the casualty in a capital sum, or to have it converted into an addition to the annual feu-duty, arrived at by taking 3 per cent. upon the capital value or amount of the composition. While it is difficult to average the chances of future casualties being relief or composition, it appears to a majority of the committee that substantial justice should be done by providing that all future casualties would be compulsorily commuted in respect of a permanent addition to the feu-duty of, say 1 per cent., on the amount or value of the composition which had already become due in the ordinary case, and a somewhat larger amount, say 1½ per cent., where by the terms of the grant a casualty is payable on every sale or transfer of the property. This payment, beginning to run from the date of the first composition falling due after the passing of the Act of Parliament requiring compulsory commutation, would provide what would be in effect a sinking fund, to serve as an equivalent to all subsequent casualties, whether relief or composition.

Taking up the subject of the enfranchisement of building leases, the committee advise that provision should be made by legislation for the enfranchisement of building leases in Scotland, whether these leases are for a term of years or upon a tenancy at will. Two methods of bringing about this result might be adopted, either (1) by compelling the lessors to sell the value of their interest for a present capital payment, or (2) by providing that the lessee should obtain a permanent right of feu upon his becoming liable for such feu-duty as would fairly represent the value of the rights which the lessor has in the subject when enfranchisement is claimed.

The next question adverted to is the acquisition of building land by local authorities. The committee suggests that the local authority, whether town council, county council, or other elected body, should be empowered to purchase land by agreement, or compulsorily, for the purposes either of providing sites for dwellings for workmen or other persons, or of other-

wise providing for the present or prospective development of the town or village. It appears to the committee that, subject to the review or control immediately afterwards suggested, considerable latitude might be left to the local authorities, both as to the purposes for which the land might be acquired, and as to the manner in which it should be dealt with when acquired, whether by letting on lease, feuing, or selling to the persons by whom it was to be occupied. A question of much practical importance, and of no small difficulty, has been brought under the notice of the committee in regard to a hardship complained of by feuars of building ground in Motherwell, Hamilton, and other places where the industry of mining is largely carried on. Having described the problem, the report proceeds:—"What has now been said sufficiently indicates the view which the committee take of the suggestions put forward in clause 1 of Mr. Crawford's bill, *vide licet*, that where land has been or shall be feued or let upon a condition that buildings were or are to be erected thereon by the vassal or lessee, any contract or agreement purporting (a) to entitle the superior or lessor to do or authorise to be done any act whereby such buildings may be injured, which but for such contract or agreement he would not have been legally entitled to do; or (b) release the superior or lessor from any liability to pay damages for doing injury to such buildings, or authorising any act whereby injury was caused to the buildings, which but for such contract or agreement he would have been liable to pay, shall be void. A majority of the committee further think that the Legislature might properly declare that the provisions of such feu grants shall be invalid in so far as they involve a repugnancy, and in particular in so far as they purport to impose an obligation upon the vassals to rebuild their houses or other erections after they have been destroyed by mineral workings, especially as the obligation would, according to its terms, bind the vassals to re-erect the buildings as often as they might be brought down by the mineral workings. The considerations which prevailed with the majority of the Judges of the Court of Session in the case of Buchanan, &c. v. Andrew, 9 M. 554, would seem to warrant such a statutory interference with the grants. A minority, however, consider that such legislation should be made applicable only to future feus. It is to be observed that little if any practical advantage would accrue to vassals from legislation limited to this point, as buildings are seldom totally destroyed by mineral workings, and it has not been proved that in any such case the superior has called upon the vassal to rebuild."

THE NEW WEST INDIA DOCK.

FOR many years the West India Dock has practically been lying idle, its depth and entrance capacity being quite insufficient. The adoption of a working union between the London and St. Katharine and the East and West India Docks Companies induced the directors of the two undertakings rather more than a couple of years ago to embark upon considerable expenditure, in order to carry out works intended to enable the West India export and import docks to be utilised in their full extent. Plans were prepared by Mr. Robert Carr, but before the execution of the contract began that gentleman suddenly fell ill, and it was found necessary to relieve him of responsibility by appointing Mr. H. F. Donaldson. Mr. Carr's services were retained for consultative purposes, but the entire scheme has been carried out under the personal direction of Mr. Donaldson, who has been publicly congratulated by both Boards on the fact that the work has been completed, not merely in the time specified, but within the original estimate of 200,000*l.*, notwithstanding that several material and costly additions have since been made to the design.

The improvement consists of a new entrance lock opening from the river into the Blackwall basin, together with two new cuts passing between concrete walls from that basin into the import and export docks respectively. As at first planned, the cuts were to have been short locks, but the directors decided that they should be open, without gates, the length being insufficient to provide lockage, while, except as a safeguard, locks were considered unnecessary. It was also proposed at the outset that the entrance lock, which is 60 feet wide, should be 430 feet long, but eventually it was resolved that the lock should be 480 feet, while the uniform depth of 30 feet over the sills will enable the docks to receive the largest merchant vessels trading to the Port of London. The dock gates, like those at Barry and elsewhere, will be opened and closed by means of powerful direct-acting rams, which obviate the difficulty caused by the fouling of twin screws when chains are used. The bulk of the work was entrusted to Messrs. Lucas & Aird, in whose contract was included everything except the gates, the machinery necessary for pumping and hydraulic purposes, and the lengthening of the railway bridges over the two cuts. Messrs. Armstrong & Co., Limited, of Elswick, have supplied the whole of the hydraulic machinery; the pumping machinery has come from the works of Messrs. Easton & Anderson, of Erith; and the bridges on the railway of the

130 BURDETT ROAD, MILE END LONDON, E.

joint committee have been lengthened from 45 feet to 60 feet by Messrs. W. Erroll & Co., of London and Glasgow, without any interruption of the traffic.

In conjunction with the new entrance, it was decided to erect a quay extension, 20 feet wide, providing six berths, on the north side of the import dock. This work was entrusted to Mr. John Price, of Westminster, and the cranes are being supplied by Messrs. Tennant, Walker & Co., of Leeds. The works do not include any addition to the warehouse accommodation provided by the docks, but a considerable sum has recently been spent in the neighbourhood of the Blackwall basin and the Junction Dock in meeting the requirements of the hardwood trade. Overhead travellers worked by electricity have there been erected for manipulating timber in large logs, and the results from every point of view have been eminently satisfactory.

The river is now much cleaner than it was some years ago. It is hoped, therefore, that the dredging necessary on the part of the joint committee will be reduced to a minimum, and the level of the water in the docks will, by means of pumps laid down, be kept slightly above the rise of the highest tides. A novelty has been introduced in connection with the delivery of water into the docks. In order to prevent the cross-currents which are always experienced when the stream enters from the side, Mr. Donaldson has adopted the principle of the domestic bath, and the water will enter at the bottom of the docks through orifices covered by metal discs. By this arrangement no difficulty will occur to ships leaving or entering the docks. The London County Council are rebuilding the Isle of Dogs bridges, and the means of public access to the new dock will thus be much improved.

ELECTRIC WELDING.

A PAPER on "Electric Welding" was read by Alderman B. A. Dobson, J.P., of Bolton, at the meeting of the Institution of Mechanical Engineers, held at Manchester. He said that practical everyday working for nearly three years of the process of welding by electric force enabled him to give certain indications and appreciations of the method considered as a practical workshop operation. During this period his firm had had two machines in operation, worked from the same generating dynamo, and employed on different classes of work.

One was specially arranged for piecing bar iron and steel, and the other and smaller machine for special classes of work of a more delicate description, such as brazing and the piecing of clean finished work, where the fire heat would have destroyed the quality of the work on the adjacent material. The statement made with regard to the requisite mechanical power placed great difficulties in the way at first, as it was found that this power had been much understated. The company having control of the welding machine supplied a portable engine capable of working up to 100 indicated horse-power with 800 lbs. pressure, and it was placed at a distance of about 45 yards from the welding machine. This got over the difficulty of power, but was of course more expensive on the score of separate attendance and other cost. But even with this engine it was found that, when piecing the larger diameters—and as yet nothing over $2\frac{1}{4}$ inches had been pieced—if the work was to be done within a reasonable time, the engine was seriously checked in speed. As considerable enlargements were about to be made to the establishment, a portion of a large dynamo-room for electric-lighting purposes was set apart for the welding dynamo and exciter. The distance of the leads from the dynamo to the welding machine was approximately 100 yards. Having a quick-running vertical engine making 140 revolutions per minute, with an extra heavy fly-wheel and abundance of surplus power, he had been able to work the larger diameters without affecting the steadiness of the arc lamps driven off the same engine; and as the load would vary 80 horse-power in the tenth of a second, this result spoke well for the arrangement of the engine and for its governing powers. The greatest variation in voltage of the lighting dynamos had been two volts. The heating effect of the passage of electric energy through a bar of any particular resistance was proportional, not to the amount of energy but to the square of the current simply. In order, therefore, to obtain the greatest heating effect with a given amount of energy, it was advisable to use a very large current at a very small pressure. With this object an alternating current was employed in the Thompson process, and transformed down from something like 300 volts to one volt or even a fraction of a volt. This reduction in pressure was accompanied by an exactly proportional increase in current, and the heating effect of the process was due to the passage of this enormous current through the bar which was to be welded. The bar itself was held between two clamps of copper having a small resistance, and the portion of the bar to be heated

for welding was that which lay between the two clamps, and which always had a much greater resistance than the clamps themselves or any other portion of the circuit. It must not be imagined that a good weld could always be made by pressure alone. No doubt if the material were perfect in character and thoroughly homogeneous, this might be the case. The iron and steel of commerce are not perfectly pure, and in order to make certain that the work might be subsequently depended upon, it was advisable that the burr formed by the pressure should be reduced by hammering in swages. In common practice at the author's works the following materials had been heated and the undermentioned work had been performed. Welding of steel of every quality, iron of every description from crown to best roller iron and charcoal iron, steel and iron together, wrought-iron and cast-iron; different diameters of the same and different materials. Rivetting in many varieties; work which previously had to be rivetted cold, and which consequently left the strength of the parts uncertain, is now done easily and certainly with the requisite heat. The piecing of countershafts and lathe spindles, where the question of exactness of length was of the utmost importance; screwing taps, rollers and spindles broken in the neck bearings, and brazing of all descriptions, had all been successfully treated. The alloys which have been tried have been done more for the purpose of experiment than for any useful end, and were not successful, owing to their not having been time to persevere sufficiently for ascertaining the precise temperatures and conditions under which the process could succeed. The practical experiments made in the author's works showed almost a better conclusion than the tests shown in published tables from the testing machine of the United States arsenal, for in bending cold here the weld had rarely given way. But in explanation of this it must be borne in mind that all the piecings of plain bars were here more or less swaged. It was well within the mark to state that there was not one out of five hundred welds which turned out a failure or even defective. The question of cost, which of course was of importance to commercial engineers, was not alluded to in detail. The author admitted, however, that the payment of royalty, the cost of horse-power, and the depreciation, which on electrical apparatus was heavy, together brought the cost considerably over the net cost of the ordinary smith's hearth work, while the actual payments in wages and so on were considerably less. The loss in weight of iron was about 1-20th only. It might be taken that on straightforward welds the total cost would be between 10 and 15 per cent. more than

the ordinary smith's work, whereas in delicate work and difficult operations the cost would probably be one-third of the smith's work. But the real advantage of the apparatus, at any rate as at present arranged, was not so much an economy as a method of securing an absolutely reliable result, and occasionally saving considerable expenditure by its special adaptability.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

FULHAM.—Sept. 6.—For Engineering Work at Western Hospital, Seagrave Road. Messrs. A. & C. Harston, 15 Leadenhall Street, E.C.

GORLESTON.—Sept. 3.—For Additions to Board Schools. Mr. H. Dudley Arnott, Architect, High Street, Gorleston.

GRIMSBY.—Sept. 7.—For Building Schools for St. John's Church. Mr. Herbert C. Scaping, Architect, Victoria Chambers, Grimsby.

HALIFAX.—Sept. 7.—For New Wing to National School, Norland. Mr. C. F. L. Horsfall, Architect, Lord Street Chambers, Halifax.

HARROGATE.—Sept. 7.—For Erection of a Post Office. Mr. H. W. Primrose, H.M. Office of Works, 12 Whitehall Place, S.W.

HARRINGTON.—Sept. 3.—For Additions to Board Schools. Mr. W. G. Scott, Architect, Victoria Buildings, Workington.

HAVANT.—Sept. 5.—For New Ward at Workhouse. Mr. Loncroft, Clerk to the Guardians, West Street, Havant.

HORNSEY.—Sept. 17.—For the Supply of 100 or 200 Fire Hydrants and Covers. Mr. F. D. Askey, Southwood Lane, N.

KING'S LYNN.—Sept. 8.—For Additions to East Anglian Hotel. Mr. E. J. Colman, Architect, King's Lynn.

LISBURN.—Sept. 6.—For Construction of Extensive Works for the Water Supply. Mr. John Lanyon, Engineer, Northern Bank Chambers, Belfast. Mr. Richard Young, Lisburn, Town Clerk.

LIVERPOOL.—Sept. 18.—For Erection of Superstructure of proposed Head Post Office. Mr. H. W. Primrose, H.M. Office of Works, 12 Whitehall Place, S.W.

LIVERSEDGE.—Sept. 3.—For Rebuilding Victoria Mills. Mr. Alfred E. Rhodes, Architect, Union Street, Heckmondwike.

LLANRWST.—Sept. 7.—For Erection of Board School and Master's House. Mr. Richard James, Llanwrst.

LLWYNYPPIA.—Sept. 10.—For Building Thirty Houses. Mr. T. B. Phillips, Llwynypia.

LOUGHAGHRY.—Sept. 5.—For Alterations to Church. Mr. Wm. Batt, Architect, Garfield Chambers, Belfast.

MARPLE, STOCKPORT.—Sept. 3.—For Construction of Outfall Sewerage Works. Mr. Henry Bancroft, Engineer, 88 Mosley Street, Manchester.

MANCHESTER.—Sept. 3.—For Providing, Laying and Jointing Iron and Stoneware Pipes, including the Building of Manholes, Lampholes, &c., of about the following Lengths of Sewers, viz.:—25 Lineal Yards of 12-Inch Iron Pipes, 1,126 Lineal Yards of 15-Inch Stoneware Pipes, 1,738 Lineal Yards of 12-Inch Stoneware Pipes, 335 Lineal Yards of 9-Inch Stoneware Pipes, 106 Lineal Yards of 6-Inch Stoneware Pipes. Mr. Henry Bancroft, C.E., 88 Moseley Street, Manchester.

MEVACISSEY.—Sept. 3.—For Building Lifeboat House, Engineer, National Lifeboat Institution, 17 Victoria Street, Westminster, S.W.

MIDSOMER NORTON.—Sept. 5.—For the Construction of Precipitation Tanks and Filter Beds, and Providing and Laying about 1,000 Feet Run of 12-Inch Stoneware Pipe Sewer and Levelling the Site of Irrigation Area. Mr. C. Nicholson Lailey, 16 Great George Street, S.W.

NEWBOLD.—Sept. 11.—For Building School. Mr. J. W. Fearn, 31 Devonshire Street, Chesterfield.

PANNAL.—Sept. 3.—For Pulling Down and Rebuilding Hotel. Mr. T. Winn, Architect, 90 Albion Street, Leeds.

PONTYPRIDD.—For Building Villa. Mr. T. R. Phillips, Architect, Old Bank Chambers, Pontypridd.

PONTYPRIDD.—Sept. 5.—For Building Board Schools. Mr. J. Rees, Architect, Hillside Cottage, Pentre.

PORTH.—Sept. 10.—For Building Forty-five Cottages. Mr. D. W. Jones, Tynewydd Hotel, Porth.

PORTSMOUTH.—Sept. 12.—For Building Board School for 2,072 Children. Mr. A. H. Bone, Architect, Cambridge Junction, Portsmouth.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz. details of work, or to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES: Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Gateposts and Frames, Architectural and other Metal Work, &c. &c.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No 203. Special thrust motion round section Bolt suitable for very narrow stile. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

PURLEY.—Sept. 5.—For about 12,000 Yards of Tar Paving and 4,500 Yards of Brick Edging at Cane Hill Asylum. Mr. R. W. Partridge, Clerk to the Asylums Committee L.C.C., 21 Whitehall Place.

TRADE NOTES.

A NEW public clock has been erected by the inhabitants in the tower of the parish church, Stanhope, Weardale, co. Durham, by voluntary subscriptions, the Right Rev. the Bishop of Richmond acting as chairman, and Mr. W. M. Egglestow as hon. secretary of the committee. The necessary work has been executed by Messrs. Wm. Potts & Sons, clock manufacturers, 13 Guildford Street, Leeds, and 22 Collingwood Street, Newcastle-on-Tyne, Mr. John Parker Stanhope doing the joiner-work. The clock is made from the designs and plans of Lord Grimthorpe.

A FRESH issue in monthly parts is about to appear of "Cassell's New Popular Educator." This work has recently been revised throughout, and new maps and coloured plates added. The first part will appear on September 25.

THE contract for supplying and fixing three lifts, together with pumping plant, at the Admiralty Extension buildings, has been taken by Messrs. R. Waygood & Co., of Falmouth Road, Great Dover Street, S.E. They also have in hand passenger and other lifts, of their latest type, as follows:—The German Embassy, Carlton House Terrace, S.W.; the Buckingham Palace Hotel, Buckingham Gate, S.W.; the Army and Navy Co-operative Stores, Coburg Row, S.W.; Mrs. Goldsmid, 14 South Street, Park Lane, W.; Earl Howe, Curzon House, W.; Wellington Court, Knightsbridge, W.; Messrs. Harvey, Nicholls & Co., Knightsbridge, W.; Avondale Mansions, Piccadilly, W.; Gower House, Euston Road, N.W.; offices, Messrs. Joseph & Smith, Basinghall Avenue, E.C.; Messrs. Johnson & Co., Farringdon Road, E.C.; business premises, 28 Bevis Marks, E.C.; Mr. S. Joseph, 1 Bevis Marks, E.C.; Messrs. Perrott & Perrott, Tenter Street, Moor Lane, E.C.; Messrs. W. Angus & Co., Leonard Square, E.C.; Messrs. W. & J. R. Hunter, 57 Moorgate Street, E.C.; Messrs. Salmon & Gluckstein, Clerkenwell, E.C.; the *Strand Magazine*, Southampton Street, Strand, W.C.; Messrs. Nicholls & Clark, Shore-ditch, E.; Messrs. Taylor, Garnett & Co., Examiner Buildings, Manchester; Mr. Louis Schwabe, Manchester; Victoria Hotel, Manchester (alterations); the Corn and Produce Exchange, Manchester; the Bank of England, Liverpool branch; the Preston Bank, Liverpool; Mr. T. Joynson, Liverpool; the Great Western Hotel, Birmingham; the *Western Daily Mail*, Cardiff; the City of Dublin Hospital, Dublin.

THE Pearn's Convalescent Home, near Plymouth, is being warmed and ventilated throughout by means of Shorland's

patent Manchester stoves, with descending smoke flues, and by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE streets and buildings committee of the Edinburgh Town Council, at their meeting, resolved to recommend the acceptance of an estimate for the construction of a new bridge over the Union Canal at Yeaman Place, at a cost of from 1,500*l.* to 1,600*l.*

VARIETIES.

THE death is announced of Mr. John Roberts, senior partner in the firm of Messrs. J. & S. Roberts, ironfounders and engineers, Swan Village, West Bromwich, at his residence, The Hayes, on Sunday, the 26th inst., after a brief illness.

THE Mold Local Board have decided to purchase land for the outfall of the proposed sewerage works at a cost of 670*l.*

THE Bangor City Council have commissioned Mr. J. J. Webster, civil engineer, of Westminster, to prepare plans for a new passenger pier at Garth Ferry. The pier, which will be over 500 yards in length, will cost about 16,000*l.*

THE clerk to the East Ham Local Board has received a cheque for 1,500*l.* from the clerk to the City Parochial Charities towards the cost of the Plasket recreation ground. This is the second sum of 1,500*l.* which has been voted from the City Parochial Charities to this purpose and another 500*l.* is promised.

THE Norfolk County Council have appointed Mr. John Marshall, of Hawick, N.B., district surveyor for Walton, in place of Mr. J. E. Haynes, resigned.

AT the meeting of the Tunbridge Wells Town Council Mr. H. Stowell, from the surveyor's office, Salford, was appointed assistant borough surveyor out of 130 applicants.

THE first stone has just been laid of the new school of science and art which is in course of erection on the site adjoining the Institute in the New Road, Bromsgrove. For some years past the committee have felt that the present building in High Street was altogether inadequate for the growing demands upon the accommodation. To counteract as far as possible the depression in the nail trade, special attention is being paid to ornamental ironwork, in the hope of promoting a new industry for the district. The building in course of erection is from the plans of Mr. John Cotton, of Oxford.

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

THE electric lighting sub-committee of the Edinburgh Town Council have accepted offers for steam-engines, alternators, switch-board, rectifiers and insulated cable, amounting to between 4,000*l.* and 5,000*l.*

THE Corporation of Liverpool, in connection with the Sanitary Institute of Great Britain, have arranged a course of lectures on "Sanitary Science" to municipal and sanitary officers, and have invited the city surveyor of Carlisle, Mr. W. Howard-Smith, to deliver a lecture in October upon "Scavenging and the Disposal of Refuse."

THE Theatre Royal, Reading, has been destroyed by fire. It was supposed that the fire must have been caused by lightning.

PLANS have been prepared by Messrs. Gotch & Saunders, of Kettering, for the erection of a proposed general infirmary for Kettering.

THE Eccles Town Council have in hand a scheme for the enlargement of the Town Hall and the erection of a new council-chamber. Land for the purpose has already been secured by the Council at the rear of the hall. Dr. J. Hopkinson has submitted a report to the tramways and electric-lighting committee on the proposed electric lighting of the main thoroughfares of the borough. The new sewage-disposal works at Saltey are fast approaching completion.

AN inquiry has been held into the application of the Harrogate Corporation to borrow 25,180*l.* for public improvement works.

AT the meeting of the Kirkintilloch Dean of Guild Court, plans for the extension of the Lion Foundry were submitted and passed. They provide for the taking in of a large piece of ground at the back of the works, whereby an additional moulding shed will be secured.

THE total value of the plans of new buildings sanctioned by the plans committee of Aberdeen Town Council at the last meeting amounted to about 14,000*l.* One of the plans was that of the new savings bank in Union Terrace. The cost is estimated at 6,500*l.*

THE Sandbach Local Board have decided to carry out a sewerage scheme for the town and district at a cost of 3,000*l.* The scheme has been prepared by Mr. Codling, engineer, of Manchester. The Board are also about to spend between 2,000*l.* and 3,000*l.* in a water scheme and in providing water for some of the districts in the area of the Congleton Rural Sanitary Authority.

NEW CATALOGUES.

WE have received from Mr. Andrew Potter, of Melbourne Works, Wolverhampton, illustrated price-lists of his various specialties. The waterproof list has every article that can be wanted, including stack cloths, cart covers, waterproof leggings, caps, coats and oilskin goods for all climates, tents, marquees, &c. The wire-netting list deals with all kinds of wire-netting and accessories, also water-tanks and troughs, corn-bins, field hurdles, gates, &c. The netting list is full of details relating to netting for animals, fishing nets, netting for games, cricket, tennis, &c. Other lists refer to the well-known belting, hose, and also hot-water apparatus on a small scale. The last list deals with everything concerned with horses, dogs, &c., horse-cloths, harness, saddles and bridles, whips, india-rubber mats, &c. In this short summary all the articles could not be mentioned, as the requirements of gardens, residences, farm buildings, &c., are endless, and therefore we must refer those interested to the lists themselves as to every possible article for use of agriculturists, farmers, gentry, residents in the suburbs, &c., with all the necessary adjuncts. Not the least among these specialties are those connected with paddock, field, stables, kennels, &c., wants on a small scale as well as large having been catered for.

ROGER DAWSON, LIMITED.

THE employes of the above took their annual bean-feast last Saturday. The party which numbered close upon a hundred journeyed by early train to Portsmouth, where a *recherche* dinner was served at the Sussex Hotel. In the unavoidable absence of Mr. Roger Dawson, who was called away on an urgent matter of business, his co-director, Mr. H. B. Johnson, occupied the chair. Mr. Johnson made some happy allusions to the growing prosperity of the Company, which were received with enthusiasm, and referred to the recent opening of their new works for the manufacture of electric-light fittings, and the new showrooms about to be opened in Berners Street. The Chairman completed an excellent speech by stating that the Company had never since its start had so many contracts and such important work in hand, and he was happy to state that there was every indication of their remaining in their present happy condition for months to come.

THE CRUCIFIXION.

MECHANICAL VENTILATION.

A PAPER was read at the Glasgow Sanitary Congress by Mr. W. Key on mechanical ventilation and extermination of spores and germs of disease. He claimed for mechanical ventilation by propulsion that grand, sweeping and irresistible air movement within rooms and halls applicable to every description of buildings, that had been found to bring within their reach that nearest approach to the outer air movement which he called "natural ventilation." He described his system at some length, and pointed out that in this city a school could be warmed and ventilated mechanically, so as to give an atmosphere of the greatest purity and at a cost of only one-fourth of a farthing per scholar per week for gas and fuel to propel and warm the air. Abundant pure fresh air and light were the best agents that could be employed for the destruction of microbes.

UNINHABITABLE HOUSES IN GLASGOW.

THE annual meeting of the Sanitary Association of Scotland was opened in Glasgow on Thursday in last week. Mr. Crawford presided.

Dr. Russell, medical officer of health, Glasgow, read a paper on "Uninhabitable Houses. Who inhabit them? Who own them? What is to be done with them?" He described the working of clause 32 of the Glasgow Police (Amendment) Act, 1890. The principle that an uninhabitable house ought to be closed until made habitable was admitted and laid down in the statute law. The question was, How best to carry out that principle? In Edinburgh and Glasgow, and with a much restricted application in England, by by-laws under the Public Health Act, the local authority, as advised by their officials, were entrusted with this duty, and with good reason. The

question of habitability was not one of law but of fact. Who better fitted than the representatives of the citizens to apply their judgment as business men to the determination of the question? In his opinion, the procedure introduced by the 32nd clause had worked admirably, and, he believed, experience was to the same effect in Edinburgh. The new powers were first applied in March 1891, and up to last July 282 houses belonging to over forty proprietors had been dealt with. A closing order had been issued in every case. No appeal had been made to the sheriff excepting in one, and that on a technical point not involving the merits. Only sixteen houses had been made habitable, so that the order could be revoked—a fact which expressed the simple truth that the remainder was so bad that it was impossible to patch them up. No complaint had been made of injustice being done, either through the press or by any association either of landlords or house-factors. He was, therefore, justified in claiming for the 32nd clause the credit of unqualified success. They had now to speak of 282 uninhabitable houses, of which 237 were inhabited. Of the 282 dealt with, 223 were houses of one apartment and 52 of two apartments. Of the 237 occupied houses, 40 were held in lots by persons who farmed them out in rooms furnished to nightly lodgers, generally families. In these uninhabitable houses the average monthly rent of a one-room house was 6s. 5d., of a two-room house 8s. 6d. This represented 2s. 1d. per head accommodated in the former and 2s. per head in the latter. Reducing the rent to a unit of air space obtained, it would be found from a table shown that 1,000 cubic feet cost 5s. 1d. in a one-room and 5s. 9d. in a two-room house. The inhabitants of the uninhabitable dwellings were obviously nomadic. It would be found that half of them lived in one place less than one year, and a third of that half, or nearly 17 per cent., less than one month. Then there was the large class of "uninhabitable casuals," to whom 36 per cent. of the uninhabitable one-room houses were farmed for nightly payments of sixpence or eightpence. But all the tenants of uninhabitable houses were not nomadic. You would find even in the worst tenements instances of prolonged tenancy which attracted your attention like ancient buildings in modern streets. Amid all the coming and going, the racket and rowdiness, these people had remained for ten, twenty, thirty, even forty years—a notable fact deserving close scrutiny as to its meaning. If you asked the employment of the inhabitant of the uninhabitable house, half of the male householders returned themselves as labourers, half of the female as simply

the housekeeper. The other half in the case of the men were shoemakers, firewood choppers, carters and a long miscellaneous list of tradesmen of all kinds, while in the case of the women they were cleaners and washers, hawkers, mill-workers, &c. There could be no doubt that, in the case of the men, excepting those who called themselves "labourers," the designation of the others was but a mark to indicate the high estate from which they had fallen. He had been in their houses, had spent much time talking with them, and his opinion was that in the main they were the *débris* of the city, the chips and dishonoured stones which fell from the social structure and littered its base. There were the open and undisguised bad, the criminal and immoral, the obviously good and the enigmatical and mysterious, who were in truth most probably bad. He should estimate the good at some 10 per cent. of the whole, including therein a few rough souls who were not exactly teetotalers, but who confined their potations to Saturday night and Glasgow Fair, and as a rule worked hard when they could get work to do. Indeed, the uninhabitable house was pervaded with the smell of whisky predominant over all the other smells. The thief and the prostitute were borne along by it through their brief and unhappy lives. The inhabitant of the uninhabitable house followed the usual law of stratification or assortment. One came to know the lair of the criminal. It was always the back land where watch was readily kept, where defence was easy and attack difficult, where shame was unknown and honour was of the quality which prevailed among thieves. When at noonday you found all the men about playing cards or loafing in the closes and on stairs, and superfluous women lolling over windows or nursing black eyes in corners, you could have no doubt of the calling of the inhabitants. The 32nd clause had broken up several such retreats of vice. It was in such quarters you chiefly met with the mysterious and enigmatical tenant. There was the house in which you were told So-and-so lived, but you never could find him in or get clearly to know what he did, for information as to the comings and goings of people in those localities was difficult to get, but the sanitary man never told the police, and so you at last learned that Mr. So-and-so did a shebeen business and really lived in a more reputable locality except from Friday or Saturday until Monday, when he inhabited the uninhabitable house. Uninhabitable houses which were found in front lands or in single-storey ranges like colliers' rows, abutting on some unbuilt-on space or ranged round three sides of a square, were usually occupied by colonies of unskilled

workmen and labourers, who might be rough in their ways and found their only relaxation in whisky, which now and then led them to the police courts as riotous and disorderly, but they were different from the vicious and criminal people of the back lands. There was also a sprinkling of undoubtedly decent people, the salt of the otherwise festering population, the ten men for whose sake, peradventure, they would not be destroyed. They might say, "Why do they remain there?" Why should the native of St. Kilda stay there? Why did the inhabitants of the Achill Islands stay there? The majority were the remnants of a previous generation of respectable tenants, all of whom had gone as the property deteriorated. A few had formed little businesses in connection with their houses and they all knew how loath people were to shift in these circumstances, so the interests of family life were apt to be sacrificed. Again, and with reference to the death-rate, there were three characteristics of these uninhabitable houses—(1) the deaths always exceeded the births; (2) the infantile death-rate was enormous; (3) the general death-rate was Mediaeval in its dimensions. The important question who own these uninhabitable houses might be very shortly answered. There were forty-one proprietors involved, and only twenty-one of these were individuals; the remainder were either trustees or executors or joint-beneficiaries. This had an obvious bearing on personal responsibility. It behoved every person in the position of a trustee to inquire into the character of the property which he administered; it behoved every beneficiary to ascertain whence the rents were derived. As for the individual proprietors, they lived in houses in the West End, in villas in the suburbs, at coast and in country. Probably no one would be more astonished than those persons themselves if they were told that they had been living on the proceeds of such property. But to plead ignorance was to plead guilty. If they did not know they ought to have known. Factors might represent them, and so keep their names from a publicity which in the circumstances they would richly deserve; but nevertheless on them and their ill-got rents he was old enough fashioned to believe a curse rested which would be sure to find them out. Just think of it. The rents were collected from week to week and month to month by their agents at the doors of those houses. It might be that the very coins which were the reward of iniquity were put into their hands. It was all the same as if they stood at the doors of those houses and held out their hands for the money. But no; they sent some one else to get it, and perhaps they gave a subscription to the

Home Mission or the Social Union, or they discussed the great city of Babylon in their drawing-rooms, and they stood afar off and lamented when they saw the smoke of her burning. The question, What was to be done with the uninhabitable house? He had already answered—shut it up until it has been made habitable. If operations were not begun at once for its restoration the structure would soon disappear. In twenty-four hours here would not be a pane of glass unbroken; in a week the window-frames, doors and woodwork would be on the move; soon the demon boy would make his way through the roof, and so the work of destruction went on until the very walls were levelled. The question, however, was not merely what was to be done with the uninhabitable house, but what was to be done with the people who inhabited it. It was for the sake of the people that the house was closed. It must be remembered that they were dealing with a limited section of the population. The effect of disturbing these people as regarded the bad was like nothing so much as the driving away a swarm of flies from a raw place on an animal. They rose in a flight and settled down upon the nearest other raw place. The criminal and the drunkard looked out for the nearest property where they would be received, and that was sure to be but a little better than the place they left. For the compact between the landlord and the tenant of such property was an immoral compact. The necessity of finding house-room made the vicious and criminal person accept any hovel; the consciousness that he had an unsound article to sell made the landlord accept the criminal and the vicious as tenants. The object to be aimed at by the sanitarian was to make such a compact impossible by taking away the only reason the landlord had for entering upon it—the fact that he was possessed of an unsound article. But caution was necessary. In Glasgow of late there had been a great destruction of unwholesome property, and consequent disturbance of this restricted part of the population, quite independently of the 32nd clause. In every case of demolition and reconstruction the original occupants were first of all dispossessed, and then the process of selection began. No owner of new property would look at the old tenants. The 10 per cent. of good tenants might go into the Promised Land, but the 90 of bad were compelled to wander in the wilderness. Supposing every landlord said, "I shall not lay out a penny upon my property. I can always get somebody to inhabit it. I shall listen to no complaint of a tenant until I get a notice from the Sanitary Department, and then I shall put off as long as possible, and lead the authorities through every form which involves delay." There were landlords who did this, or their doctors for them. But suppose all did so, what would be the state of the city? He need not attempt the description. Supposing, on the other hand, every landlord said, "I shall keep my property in thorough repair; I shall inquire into every complaint from my tenants, and attend to every notice from the Sanitary Department, and by inspection endeavour to anticipate complaints. I am determined not to harbour thieves and prostitutes: I shall not put up with the drunkard and the night brawler; I shall not make the world easier to live in for the profligate and the unclean." The majority of landlords and factors set before themselves this standard of business. Why not all? If all, what then would be the state of the city? There were many schemes of social restitution before us at present. The oldest was to be found in the Bible, and was based upon righteousness—not righteousness in the air or in the earth, but in the individual. If he were desirous to promulgate a theory of social reform, he would base it by preference upon the higher morality of house owning—a very broad basis, because it included not merely the landlord and the factor, but the trustee and the beneficiary and the bondholder; and besides it touched every tenant. Let us not for gain make broader the way which led to the destruction both of body and soul.

Dr. J. C. McVail said that in the counties of Scotland as distinguished from the burghs the Housing of the Working Class Act took the place of the local Act, whose operations had been described by Dr. Russell. In mining districts, where it was alleged that the minerals would be wrought out in a few years, the closing of houses required to be carried out with much discretion, as there was a strong disinclination on the part of private individuals to erect new houses in their place. In one case he had been consulted by a mining firm as to the plans for a number of new houses in course of erection, and they gladly accepted his suggestions, their policy being that in time of unrest as between labour and capital miners would in many cases prefer to live on in habitable houses rather than go to worse houses connected with pits where the pay might be slightly greater. This was the right view for owners of such properties to take. In the end good house accommodation paid everybody—tenant, landlord and mine-owner.

Mr. Lindsay said one of the great difficulties in country districts was the determining of what was an uninhabitable house. People were found living to an old age in such houses, and it was difficult to prove that they were injurious to health. The Public Health Act should be amended on the lines of the

Municipal Act. It should not be necessary to prove that the house was injurious to health. It should be enough if certificates were granted by three or four responsible officials. He further complained that there was a lack of supervision of house property while in course of erection.

Dr. Munro, Renfrew, said the question had been asked what to do with the uninhabitable houses, but his own particular concern was what to do with the evicted tenants. In the counties the difficulties were greater than in the city. The only solution, he believed, was that this residuum must be the special charge of the community, who must make provision for housing them. They required to be policed into anything like good hygienic habits, and only under the operation of compulsory powers would municipal authorities be enabled to maintain model buildings under model conditions.

The Chairman, in closing the discussion, remarked that it should have some definite practical outcome. They were going to have next year a new Public Health Act for Scotland, and he thought there should be embodied in it powers to local authorities, rural or urban, similar to those we had in Glasgow. The moral effect of these powers had been enormously greater than the figures given by Dr. Russell showed. The plea that was almost always put before the court was that the parties implicated were willing to do anything the court might order, and that if the officers came in a month or two they would find that defects had been remedied. But the court held that they had been found breaking the law, and the punishment of breaking the law was that the houses must be closed. The moral effect of this upon proprietors throughout the city had been greater than the effect they had been able to achieve by passing closing orders. He moved that they should call upon the Secretary for Scotland to insert in the new Public Health Act a provision giving similar power to that contained in the Glasgow Act to all local authorities.

The motion was carried by acclamation.

TESTING INSTRUMENTS.

A PAPER was read at the meeting of the British Association in Oxford on "Engineering Laboratory Instruments and their Calibration," by Professor David S. Capper, M.A. He said that the reliance to be placed upon observations made with measuring instruments evidently depends primarily upon the accuracy with which these instruments record. Neglect of this fundamental truth often leads to inaccurate and erroneous deductions from experiments which are themselves of the highest scientific value; not infrequently the whole value of observations may be destroyed by insufficient care in the calibration of the instruments used. The subject is therefore one of some importance. The author describes the chief sources of error in some of the most common engineering investigations and their probable value, and points out some of the possible methods of correction where such exist. For example, in engine trials there are many possible sources of error. Most of these may be reduced in percentage value by continuing the trial for a sufficient period. But this is not the case with errors which may occur in the indicators, gauges or spring balances used in the determination of power. In these, unless properly calibrated before trial, very serious errors may be introduced, amounting in some cases to 5 and 6 per cent. of the total power indicated. It is therefore absurd, even if proper precautions have been taken, to rely upon horse-power measurements to two places of decimals.

Similarly with regard to tension and compression experiments with standard 10-inch bars. Here calibration of the testing machine is extremely difficult, and can in general only be carried out over a small portion of the experiments. Deductions have, therefore, to be made from the less to the greater, with the result that small errors in the calibration will tend to be magnified. Vertical testing machines have fewer sources of error, and can be calibrated with more certainty than horizontal machines. Extensometers are, however, much more easily applied to a horizontal bar than a vertical, and variable jockey weights, which are requisite if the same accuracy is to be maintained at low loads as at high, are also more readily adapted to horizontal machines.

Extensometers can be made and calibrated well up to the accuracy of the testing machine. With standard bars and a measuring instrument true to the ten-thousandth of an inch, the modulus can be relied upon to the second significant figure. It is doubtful if more can be obtained without very special construction and calibration of the testing machine.

The difficulty in bending experiments again lies in the accurate application of load. Unless the beams are very short or of unmanageable cross-sections, the load measurement must be very delicate if readings approaching the accuracy of those in tension are to be obtained. It is possible that some of the discrepancies in published beam experiments may be due to this cause.

THE BUILDING TRADE IN GLASGOW.

WHILE, in consequence of the coal strike and from other causes, the majority of industrial trades in Glasgow are at present quiet, this is not the case with the building trade, says the *Glasgow Herald*, in which the operative masons and stone-cutters are fully employed, and it is estimated that from 500 to 600 additional masons and builders could easily find employment in the city. Notwithstanding the depression in other trades, master masons have been short of men for a considerable time now, and there is a standing difficulty in procuring a sufficient number of tradesmen to carry on the various works in process of erection so as to fulfil contracts. Besides a large number of tenement buildings, there is unusual briskness in erecting handsome structures in the city, which gives steady employment to a considerable body of the men. An excellent arrangement which prevails between the employers and operatives is that there is an annual conference held in April, which fixes the standard wages for the year. It works well, and the present standard is $8\frac{1}{2}$ d. per hour. Those conferences have existed for the last ten years, during which time there has been no friction, either in respect of wages or of the conditions of employment. There are said to be large numbers of men in the South who cannot get employment; and even in the United States, where it is customary for many of our countrymen to seek employment in summer, returning to their homes in winter, the building trade is in a depressed state. Notwithstanding the great increase of the city, it is said that in 1874 and 1875 there were more masons, builders and hewers than there are at present.

HYGIENE OF SCHOOLS.

At the Sanitary Congress, Glasgow, Dr. Glaister read a paper on "School Hygiene," in which he discussed school space and its relations to the health of scholars and teachers. That subject lay at the foundation of the health requirements of school life, and involved some of the nicest and most important problems of sanitary science. Under the Education Act, the amount of superficial floor space required per scholar was 8 square feet and the cubic space per scholar 80 cubic feet. No allowance was made for the difference of the age and bulk of individual scholars; that was to say, the advanced pupils in one room had the same average amount of space as the

infants had. Under the new code, however, a somewhat more liberal average was laid down. The floor space was increased to 10 square feet per scholar and the cubic space to 100 feet. Having discussed the subject at some length, he observed that it seemed to him that the first point to be insisted upon was (1) an increase of school space per child to the extent that for each child there should be an average of 18 square feet of superficial floor space, with a ceiling not more than 14 feet in height, giving, approximately, 250 cubic feet per child; (2) the above school space should be accompanied by such special provision for ventilation as would not operate prejudicially on the scholars. Alternatively with mechanical ventilation smaller school spaces than the foregoing could be adopted, viz. 12 square feet floor space, with a ceiling not more than 14 feet high, giving 168 cubic feet per scholar, would be adequate; but 14 square feet floor space, with same height of ceiling, giving 196 cubic feet per scholar, would be much better. It appeared to him that the time was now ripe for a reconsideration of school spaces. While we had been advancing in our demand for cubic space for adults, we had been practically standing still in this direction for children, and surely the health of the coming generation was as important as that of the present adult population. If the State insisted on the compulsory education of every child, it ought to be the business of the State to see that, during the progress of that education, children should be placed in the best possible hygienic surroundings. He was not concerned respecting the economic aspect of the question, for he believed that, in the improved condition of the children, in the decrease of the death-rate of the children that would ensue, and the better protection of our children against epidemic and other diseases, the ratepayers of the country would be amply repaid, and that healthier men and women, and more of them, would be reared for the country's good.

HYDRAULIC POWER SUPPLY IN SYDNEY.

(Concluded from last week.)

THE boilers are four in number of the double flue, Lancashire type, and are made of steel plates and angles throughout. The boilers are 7 feet in diameter by 25 feet in length, each being fitted with one 4-inch Hopkinson's dead-weight pyramid

safety valve and one $\frac{3}{4}$ -inch double lever safety valve. The boilers are fired by Vicar's mechanical stokers with movable fire bars. The stokers can be adjusted both in the hopper feed and in travel of fire bars to meet the irregular demands for steam which the installation has to meet. These stokers convert the firegrates of the boilers into a kind of gas furnace; all smoke is consumed. The mechanical stokers have been an unqualified success; the coal used is screened small, and excellent working results have been obtained. During the coal strike about two years ago the Melbourne Power Company were compelled to resort to the use of coal slack and breeze, which with similar mechanical stokers gave satisfactory results, though at the time they were short of boiler power. The combustion is perfect, the residue from furnaces being thoroughly spent. If the advantages of the mechanical stokers were better known they would be more generally adopted. Two mains leave the pumping station in Pier Street running in the same line until Sussex Street is reached, in Liverpool Street. At this point the mains diverge, one following Sussex Street to Market Street. At Market Street a circuit is formed by connecting the Sussex Street main and the main in Pitt Street. From Market Street 6-inch mains are continued through Pitt and George Streets, connecting again at Bridge Street. From Market Street a 6-inch main is continued through Kent Street to Miller's Point, continuing along Windmill Street with the intention of joining the Pitt Street main at Circular Quay. Smaller circuits of 4-inch and 3-inch mains have been laid around many of the city blocks, connecting at two points with the trunk mains. Stop valves are provided on the mains at about 300 yards apart, and also at the junction of all sub-mains, so that any section can be isolated if necessary. Should a fracture of the main occur, the stoppage is limited to the time occupied in shutting down the valves at each end of the section on which the break takes place. There have only been two breaks on the mains since the company commenced to supply power, one occurring at night on a branch main causing no stoppage. The second break brought down the accumulators; in fifteen minutes the section was cut off, and pressure restored throughout the system. The time occupied in reinstating a broken pipe is about four hours. All pipes, bends and tees are of standard lengths, and tested, when manufactured, to 2,500 lbs. per square inch. After being laid a further test of 15,000 lbs. per square inch is made to test the joints before filling in the trench in which the pipes are laid.

Air-cocks are fixed at all high points in the mains through which the air is displaced in charging the mains. Tee-pieces for 2, 3 and 4-inch branches are placed at convenient points on the line of mains, from which service-pipes can be carried to the consumers' premises when required. In making a connection to the consumers' premises a stop-valve is provided on the main at a point near the building; also a back pressure or non-return valve is fixed near the machine. Should a pipe or main break, the non-return valve is closed by the pressure on the top side of valve, and the water is thus prevented from leaving the cylinder, and the car or load from making a rapid descent. Owing to the nature of the Sydney streets, the mains have been laid underneath the footways; this has many advantages—being near the building line a shorter and cheaper connection can be effected, and obviates any necessity for disturbing the wood-blocking in the streets and the consequent expensive reinstatement. Repairs are also much easier carried out. The total length of pressure-mains laid up to date is 21,120 yards, equal to 12 miles; about 2,640 yards of return mains on the watershed to the works, where the water would return by gravitation, without exerting a back pressure on the consumers' machinery. After the water supply from Waterloo was decided on, any further extension of return-mains was discontinued. I omitted to mention the mains also extend on the Pyrmont side of Darling Harbour to Pyrmont Bridge road; power is being supplied to 19 cranes, and also to the wool stores of Messrs. Goldsborough & Co. and Messrs. F. L. Barker & Co.

The water for the power-supply is obtained from two sources; operations at first were commenced with a connection from the city water-supply, a 6-inch connection being laid to the storage-tanks at the works, but an initial cost of 1s. 6d. per 1,000 gallons, and even at the reduced rate of 1s. per 1,000, was a serious drawback in supplying the power at a reasonably cheap rate to large consumers. Steps were therefore taken to secure if possible a cheaper water-supply. With this in view 10 acres of land lying between Mount Rennie and Waterloo at the foot of the sand hills was secured on a long lease. A storage-dam was excavated of 750,000 gallons capacity, which has since been increased to about 1,000,000 gallons. A small pumping-station was erected and equipped with one set of Worthington pumping-engines (compound condensing) equal to raising 25,000 gallons per hour, together with the necessary boiler-power. The Waterloo station is connected to Pier Street by $2\frac{1}{2}$ miles of 9-inch and 6-inch main, $1\frac{1}{2}$ miles from Waterloo

being 9 inches in diameter. This is the rising portion of the main, and brings the water over the highest point in Redfern, after which the water reaches the central pumping-station by gravitation through 1 mile of 6-inch main. The water is delivered to large storage-tanks at the pumping-station. These tanks form the roof over engine-house, and measure 50 feet by 40 feet by 8 feet deep, equal to 100,000 gallons; the tank is divided into two compartments, the water being delivered and allowed to settle in the first, after which it overflows to the second section of the tank; the water then is supplied to the pumping-engines, the supply-pipes to pumps being in duplicate. The hydraulic power-water is sold by meter, the charges being based on a sliding scale, commencing with a minimum charge of 3d. per quarter, for which sum 5,000 gallons is supplied. Where the consumption reaches 275,000 gallons per quarter, the charge is 5s. per 1,000 gallons, and where the consumption reaches 300,000 gallons a special rate is given. Water is now being supplied in Sydney to large consumers at 4s. 2d. per 1,000 gallons. The principal use of the power is for intermittent work in cases where direct pressure can be employed, as, for instance, passenger lifts, warehouse hoists, cranes, presses, &c. For such purposes hydraulic power has long been recognised as being the best and most trustworthy. It is not, therefore, surprising to find that the hydraulic power companies in Sydney and elsewhere have secured so large a share of the lifting work. In all cities where public hydraulic supply has been introduced it has proved more convenient and satisfactory than any private system of power supply, and the sliding scale of charges adopted has brought it within the reach of both large and small consumers with advantage to both. Circumstances differ so widely that it is not perhaps possible to make any general statement as to the economy of hydraulic power over older systems, but in many cases the owners of lifting plant have found the saving sufficient to pay the cost of the new hydraulic machinery substituted for steam or other plant in three or four years. In Sydney the use of private installations of power-producing plant have in many instances been discontinued. To my knowledge, not less than twenty-five gas-engines, representing 175 horse-power, have been supplanted by the Public Power Supply. The 175 horse-power quoted was used for the running of thirty-eight lifts, or an average of 4.6 horse-power each. Taking, say, 200 lifts, the number now connected to the supply mains, and allowing 4.6 horse-power for each, the total required would be 920 horse-power, whereas the horse-power indicated

at the works is about 105 during the busiest hours of the day; this illustrates the economy derived from averaging the requirements of individual consumers. The result of working a large number of machines from one central station reduces the consumption of each to a common average, though a considerable variation in the demand for power exists at different hours of the day. Assuming that the 200 machines at present running consume, say, 4 horse-power each, 800 horse-power would be required, but in actual work we find that the average maximum demand is $\frac{1}{2}$ horse-power per machine as indicated at the station, the maximum output being from 12,000 to 13,000 gallons per hour. The machinery connected to the system comprises the following:—Passenger and goods lifts, 149; whip hoists, 22; dumping presses, 7; cranes, 20; motors, 3; total, 201. One of the most important points in the distribution of the power is the necessity of the perfectly sound condition and integrity of the mains—the velocity of water at 700 lbs. pressure through a free orifice being 320 feet per second, a very small hole is required to pass a great body of water. Any abnormal increase in the output is evident during the night, if due to leakage, as the demand during about four hours is very low. The number of gallons delivered to the mains is indicated by the counters fitted to each engine. Should any unaccounted for increase occur each section of the main is cut off during the night, each valve being closed at intervals of fifteen minutes, readings of the counters being taken at the same time at the station. When the section on which the leak occurs is cut off, the revolutions of the engine at once indicate the leak, which, after being located to a particular section, is soon discovered. The meters used for measuring the power to consumers are of various types, viz. Parkinson's fan meter, Siemen's, Kent's positive meter, and Tylor's. The water has hitherto, in nearly all cases, been measured on the exhaust side of the machines. High-pressure meters of the Kent's positive type and Tylor's turbine system have been introduced with good results; these meters in construction are identical with the low pressure, the casting only being strengthened to withstand the higher pressure. Another class consists of piston meters, as the Schoneyder; in these, the water passing through a cylinder or cylinders actuates a piston which in turn is geared to an index and records the volume that is passed. The Parkinson type of meter is based on the principle that is employed for gas meters, the water being admitted on one side of a drum, which is divided into compartments. The drum is caused to rotate by

the entry of the water which passes through it to the delivery of the quantity of water; thus each compartment being known the volume that is passed by each revolution is recorded on the dial. Kent's positive meters have also been used on the high-pressure side of the machine with very satisfactory results. The efficiency of the meters and condition of the mains is tested or checked by counters on the pumping-engines, such reading being multiplied by a constant representing the capacity of the pumps per revolution, less the 5 per cent. allowed for slip. A great advance has been made during the last few years in the class of lifts and hoists used in conjunction with hydraulic power. Sydney is in no way behind in this respect—in fact, I have no hesitation in saying that we have in this city some examples of hydraulic lifts not equalled in any part of the world, notably the direct-acting hydraulic passenger-lifts at the Hotel Australia, the Government Lands and Works Offices, the Mutual Life Association, and the latest installation at Messrs. Anthony Horden & Son's new premises, all of which have been designed by Mr. Norman Selfe, the inventor and patentee. We have also some very complete and perfect examples of the suspended hydraulic lift as supplied and erected by the Waygood Elevator Company and other makers. For economy of water for work done the suspended elevator, if properly balanced, stands first; the balancing of the lifts is carried out even to compensating for the weight of ropes when the lift is at the bottom limit of travel. I have not seen this applied in Sydney, but it is in general use in Melbourne where the buildings are much higher, and the weight of lifting ropes correspondingly greater; all these improvements have added to the efficiency of the modern elevator. Evidently we have not yet reached anything near perfection, for we have now running in Sydney a multiple power lift known as Carey's patent, introduced by the Waygood Company, for which excellent results are claimed. Three cylinders are placed side by side, with rams to each of equal diameter; the rams are inserted and fixed to one common crosshead; the three powers are controlled by an automatic valve which adjusts itself to the load placed in the car; should the load be under the limit of first power the pressure is admitted to the centre cylinder, the outer cylinders being filled from an overhead tank to which the exhaust water is delivered; if the second power is required the pressure-water is admitted automatically to the two outside cylinders and water from tank to centre cylinder; should the third or full power of lift be required, pressure is admitted to all three cylinders. The automatic working valve is controlled by

a governor arrangement which prevents the valve moving further over than the power required. The dream of all lift-makers is the ideal lift that will consume water in proportion to load raised. The driven machinery is of as great importance to an economical and satisfactory result as the distributing plant, but this fact does not receive the attention it deserves. Regulations are issued by power companies defining the conditions to be observed by manufacturers in fitting up machinery for connection to the system. These regulations are given in order to secure safety and efficient registration of the quantity of power used; but the score of economy and efficiency of the machines is left to be settled between the makers and the consumer. Outside of the operations of the power company we have in New South Wales several extensive installations of hydraulic power on the high-pressure system, the most important being at Newcastle, where the system has been adopted for the shipment of coal, the capacity of the pumping-station being nearly equal to that of the power company described before. In Sydney we have the installation at the Hotel Australia, also at Messrs. A. Horden & Son's, Lamb's Wharf, Miller's Point; the Pastoralists' Association, North Sydney, and the Australian Gaslight Company, where the coal is discharged from the colliers by quick-running hydraulic portable cranes, which can be moved to suit the hold of the vessel; two large hydraulic lifts are also in use for raising the coke, &c. from works to Kent Street level. All these installations are worthy of note. One fact forcibly presents itself to anyone who has given any attention to hydraulic appliances, viz. the absence of any wharf cranes in Sydney for the discharging of heavy weights, such as locomotive boilers and other heavy material. In Melbourne the Harbour Trust have erected several cranes, one equal to raise 25 tons; the cranes are connected and worked when required by the power company at a charge per hour when the cranes are in use. The Harbour Trust have thus all the advantages of the cranes for heavy lifts, without the standing charges which would attend any pumping station under their own control.

THE
Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

MR. ROBERT W. STEWART, of Tenter Street, Goodman's Fields, is introducing a new pigment which, when better known, should command an extensive sale. This colour, which for brilliancy compares with genuine vermilion, of which it is only one-fourth of the price, possesses fineness, body and durability, and it can be applied in oil or varnish to either inside or outside work. Another novelty, of which Mr. Stewart is making a specialty, is his Scotch soap powder or crystallised soap, which is specially manufactured for washing town paint and varnish work. It possesses the merits of being cheap, very portable, effective, clean and easily applied. It does not, moreover, leave a greasy surface or injure the work.

THE extensions to the Llanelly Hospital, which are nearing completion, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Hendon Local Board having decided, on the recommendation of their surveyor, to test the practicability of using Rutty's patent macadam road scarifier, to be worked by their own steam-roller, thus employing their own plant and labour, a machine has been sent to them, and is now being worked in the Edgware Road with satisfactory results, 500 yards super per hour being easily scarified; an ordinary draw-bar affixed to their roller has been found sufficient to enable them to use the scarifier.

VARIETIES.

IT is estimated that in the forests on the western district of Minnesota, which were exposed to the recent fires, there were 150,000,000 pine trees. The Diamond Match Company owned two-thirds of them. The timber which remains will have to be cut this year.

THE new City of London School for Girls, which has been erected in Carmelite Street at a cost of 20,000*l.*, will be opened on Thursday next.

ABOUT 14,000*l.* have been spent by the Corporation of London in building new offices at Guildhall and generally improving the accommodation for the staff of officers. The work, which has included the building of new quarters for the town clerk's, chamberlain's and surveyor's staffs, has extended

over two years. A sum of 200 guineas has also been expended in fitting the main entrance with new oaken doors, which have been designed by Mr. A. Murray, the surveyor to the Corporation. They are of fifteenth century style.

THE *Glasgow Herald* says:—Having regard to the number of applications for linings which continue to come before the Dean of Guild Court, the boom in building in Glasgow shows no sign of slackening. At the last sitting of the court, leave was given to erect no fewer than nine new tenements of dwelling-houses in different parts of the city, whilst the Central Drill Hall Company (practically the 5th Lanark Rifles) were authorised to proceed with a drill hall, armoury and headquarters in Garnethill, and the trustees of the Savings Bank of Glasgow to put up new buildings at the corner of Ingram and Glassford Streets. Numerous applications of a minor character were also granted.

THE licensing magistrates at Aberystwyth have granted two licenses for an hotel and park and cliff gardens and pavilion, to be erected by Mr. Grant, of London, at a cost of 20,000*l.*

THE death is announced of Mr. William Chalk, who has for the last thirty years been prominently identified with the iron trade of Lancashire, at his residence in Birkdale, Southport. Managing partner for Messrs. Thompson & Co., iron merchants, Manchester and Wigan, all his business life has been connected with the iron industry of the country. He filled many public offices in Wigan and the district, and was deservedly respected. He was fifty-three years of age, and his death will be regretted by a large circle of friends.

AN appeal has been issued on behalf of the buildings extension scheme of Aberdeen University. The total expenditure is expected to be 140,000*l.* The subscriptions already received, including 10,000*l.* from the Town Council and 20,000*l.* from Dr. Mitchell, Newcastle, amount to 50,219*l.*, and the Government grant to 40,000*l.*, leaving to be raised in round figures 50,000*l.*

ATTEMPTS to settle the disputes with the stonemasons and plumbers of Bolton having failed, the Bolton Master Builders' Association decided to lock out all the operatives in the building trades. Over a thousand men are affected.

THE Glasgow Corporation Water Committee are nearly prepared to supply hydraulic power for hoists and other purposes. It is expected that this will be on or about the beginning of the new year. The price of the power, it is said, will not be so much as that charged by the London hydraulic companies.

THEATRES, ETC.

AT the meeting of the Docks and Pilotage Committee of Aberdeen Harbour Board it was decided to recommend the Board to extend the wharf on Regent Quay (Upper Dock) by 410 feet, and to erect a shed 22 feet in length by 35 feet in width. The estimated cost is 5,227*l*. The wharf on the south side of the basin will also be extended by 260 feet.

AT the meeting of the sewage committee of Glasgow Police Commissioners approval was given to a scheme prepared by Mr. McDonald, the city engineer, for the erection of sewage purification works at Dalmuir, similar to those at Dalmarnock, for dealing with that part of the sewage of the city on the north bank of the Clyde not touched by the east-end works. The scheme proposes that the greater part of the drainage area to be dealt with, covering 4,500 acres, shall be carried in a gravitation sewer, without pumping, to the Corporation lands at Dalmuir and there purified; it is also proposed that the lower levels of Glasgow and Partick, extending within the city boundary to 800 acres, should be pumped into an outfall sewer at a station on the Kelvin.

AT Egremont an inquiry has been held by the Local Government Board into an application by the Wallasey Local Board for powers to borrow 25,000*l*. for the purpose of building ferryboats. It was explained that the new boats had become necessary owing to the increased population of the district, and because of the opening at an early date of a branch of the Wirral Railway to Seacombe.

It is understood that Mr. Hugh Brown has been nominated next Glasgow Lord Dean of Guild.

THE Dereham Local Board have applied to the Local Government Board for sanction to borrow 1,100*l*. for the purposes of a new pig market.

AT the meeting of the Stockport and District Board of Guardians, an intimation was received from the Local Government Board to the effect that on the return of certain forms properly filled up an order will be issued enabling the Guardians to purchase a site near Hazel Grove for the erection of a new workhouse, the cost being about 6,200*l*.

THE Eccles Town Council propose to apply to the Local Government Board for power to borrow money for the provision of a town's yard for the borough. Plans have been prepared by the surveyor, Mr. A. C. Turley, C.E., and the work is estimated to cost about 7,000*l*. Provision is made in the plans for the custody of three fire-engines (two steam and one manual), stabling for twenty-three horses, &c.

THE Liverpool authorities have received notice to the effect that the Home Office has agreed to the purchase of the Kirkdale Gaol site by the Corporation for the sum of 17,650*l*. Thus a populous part of the city will in the near future be in possession of a valuable recreation ground.

THE Tonbridge Gas Company have, in consequence of the rapidly-increasing consumption of gas, decided to make extensions, including a new large gasometer, three new branches of retorts and a new coal store, the estimated cost being 7,000*l*., with the purchase of two acres of land.

AT the meeting of the Manchester City Council, Sir John Harwood mentioned that the Thirlmere lake was now filled up to the 20-foot level, and the water was running over in St. John's Beck. The committee had not thought that they would be able to open the works until April next; but matters were in such an advanced state that they proposed that the Prince of Wales should be asked to perform the ceremony next month.

ELECTRICAL.

AT the meeting of the gas and electric committee of the Glasgow Town Council, it was agreed that the price of gas should remain at 2*s* 6*d*. per 1,000 cubic feet, and that the price of electric light should be continued at 6*d*. per Board of Trade unit, being the price to which it was reduced from 7*d*. some time ago.

AT the meeting of the Worcester watch committee the sub-committee reported having received a number of applications for the electric light. The applications acceded to included several churches, and it was stated that the dean was anxious to have it put in the cathedral. It was decided to recommend the Council to vote a sum of 1,000*l*. as working capital to pay the cost of such extensions as the committee might decide were necessary.

AT Wolverhampton it is proposed to introduce the electric light in Walsall Street new Board school, at a cost of 233*l*.

THE *Scotsman* says:—By way of experiment, Nicolson Square, Edinburgh, has just been fitted up, at the instance of the Town Council, with incandescent gas-burners, which were lighted last night for the first time. There are four lamps along the front of the square and five on the two side streets, or nine in all. The burners used for outdoor lighting are about twice the size of those fitted in shop windows. The mantle is

OVER ONE HUNDRED PER CENT. PER ANNUM

An investment bringing in such a return in these dull days is worthy of attention. In a letter to the YOST TYPEWRITER COMPANY, of date April 4 last, Messrs. PRICE BROS., of Dudley, wrote:—

"As to the objection of first cost, all we have to say is that we saved the cost of our Machine in less than twelve months."

TRADE MARK

REGISTERED

The Machine referred to as such an excellent investment was a YOST Typewriter. The YOST will yield you the same return that it has brought to Messrs. PRICE BROS.

MANCHESTER: 3 Deansgate. LEEDS: 21 New Station Street. BELFAST: 9 Rosemary Street. BIRMINGHAM: 73 Temple Row. GLASGOW: 211 St. Vincent Street. PARIS: 36 Boulevard des Italiens. LIVERPOOL: 7a Lord Street.

larger and stronger, and there is a bulb globe and metal top. Each of the large burners consumes $3\frac{1}{4}$ cubic feet of gas per hour, or about a foot more than the burner in the ordinary street lamp, and the light given out is estimated to be equal to 75 candles. Under the influence of this light the square—usually very dark—had a more cheerful appearance. One of the lamps did not burn well, but it was explained that that was owing to the fact that a larger quantity of gas was passing through the pipe than could be consumed. Though the night was rainy the installation attracted a good deal of notice. When the Council go to see the lamps they will have a ready means of comparison between the incandescent light and the electric light by a reference to the electric lamps over the door of the Empire Theatre adjoining.

HEATING POWER OF SMOKE.

MR. R. R. TATLOCK, dating from the City Analyst's and Gas Examiner's Laboratory, Glasgow, says:—It appears to be generally understood that a large percentage of fuel is lost in the smoke which issues so abundantly from most chimneys, and random statements have been made to the effect that the loss in heating power due to this passing away of combustible matters in smoky furnace gases may reach as high as 30 per cent. of the whole. A little consideration, however, will show that the loss of any large percentage of combustible matter, and consequently of heating power, is quite out of the question. This may be proved in two ways (1) by calculation of the two sources of heating power as shown by an analysis of coal or dross used for steam raising; and (2) by actual analysis of the furnace gases for combustible solids and gases. Annexed are the results of these two methods of observation, the same dross being analysed and also employed as fuel in a works furnace, from which smoky gases were given off which were tested for combustible purposes.

Mr. Tatlock goes on to say that the points to be observed are the relative proportions of heating power (represented in the analysis by the number of pounds of water at 212 deg. F. capable of being evaporated to dryness by 1 lb. of the fuel) given out respectively by the combustion of gas, tar, &c., and by fixed carbon. These are calculated according to Playfair's well-known formula, which was practically tested on coals intended for the British navy, and which shows that while 1 lb. of fixed carbon is capable, when burned, of evaporating 13 lbs.

of water at 212 deg. F. to dryness, 1 lb. of the gas, tar, &c., will only evaporate $3\frac{1}{4}$ lbs. From these figures it appears that in this coal or dross the gas, tar, &c., only contributes 15 per cent. of the total heat given out during the combustion, and that the fixed carbon produces the remainder, or 85 per cent. In coals with less of the former ingredients and more of the latter, which is commonly the case, the proportion given out by the volatile constituents would be considerably reduced. It is thus perfectly clear that even though the whole of the volatile matters (which can alone be accountable for any loss of combustible material) escaped combustion, there could not possibly be a greater loss of heat than 15 per cent. of the whole, even in such an extreme case as this represents.

The analysis was made of the furnace gases given off during the burning of the dross is also recorded. It has been asserted that carbonic oxide is given off in considerable quantity when much smoke is being produced, but it does not appear in this case, and Hempel in his work on "Gas Analysis" comes to the conclusion that little or no combustible gases are present in furnace gases. In the volume referred to (page 205) Hempel says: "Furnace gases usually contain only carbon dioxide, oxygen and nitrogen. All other gases are present in but very small amounts. In oft-repeated analyses the author has always found only traces of carbon monoxide, methane and the heavy hydrocarbons." This is in complete accord with the analyses given above, and it may be taken for granted that the presence of carbonic oxide or other combustible gases in furnace gases is a most unusual occurrence. This is quite conclusive evidence that no appreciable loss of heat, even when the furnace gases are smoky, can be attributed to the passing away of the products of imperfect combustion, in the gaseous form at least.

That there is loss of combustible matter in the smoke is an undoubted fact, but the quantity seems also to be greatly magnified in certain random statements. In the experiment made the soot collected consisted largely of mineral or incombustible matter. In several experiments to estimate the soot in furnace gases similar results to these were obtained. To find how much carbonaceous matter was actually lost as smoke, it will be necessary to know the number of cubic feet of furnace gases given off by the combustion of, say, 1 ton of the dross. If the percentage of carbonic acid in the furnace gases is taken at 5 per cent., the total volume of these given off from 1 ton dross would be about 940,000 cubic feet measured at the ordinary temperature and pressure, and this would contain

41 lbs. of carbonaceous matter and 27 lbs. of mineral matter. This would represent 1·83 per cent. of the volatile matters (gas, tar, &c.) given in the analysis of the dross, and if from this is now calculated the heating power according to Playfair's formula, it will only come to 0·057. This figure, compared with the practical heating power (7·75) of the dross, goes to show that the solid combustible matter of the smoke can only account for the very small percentage of 0·74 of the total heating power which can be obtained from the coal.

From the results of these experiments it is evident that the loss of combustible matters in smoke is very small indeed, and that the belief in immense loss by this cause is simply a fallacy, and is decidedly not corroborated by experiment. In adopting methods of removing the smoke nuisance, it must, therefore, be borne in mind that there is little or no gain in burning smoke.

ROUTINE IN CHICAGO.

To the inexperienced property owner who desires to get a permit for the erection of his building in the building department of the City Hall, Chicago, the task before him, says Mr. Francis J. Norton, is a difficult one. He is obliged to present his plans and drawings to no less than a dozen experts before the official stamp of the building commissioner is put upon them. It is a common occurrence to see two-thirds of the plans submitted for inspection in the building department rejected. Why should there be such a great number of high-salaried employes, at the expense of the public, inspecting the plans in question? Why should such a state of affairs exist in this great metropolis of the West? Why not insist on a recognised status for the architectural profession, and license architects same as the medical and legal professions, and insist that plans submitted to the building department of the city of Chicago should be attested by the signature of a professional architect licensed and qualified to draw them? Assuming that the public would be obliged to pay a few dozen high-salaried officers to examine the death certificates presented by the public from doctors, or to have experts looking over the documents filed by lawyers, or the opinions they give their clients, what a howl the public would make. Yet such is the neglected state of affairs in the building departments and the architectural professions in Chicago. No doctor, no lawyer will assert that the medical and legal professions are not in a higher standing, both before the public and among themselves,

than if the entrance to their professions were without restrictions, same as thirty years ago, when Massachusetts, Indiana, Ohio, New York and other States passed laws prohibiting lawyers or doctors practising without a strict examination. Architecture should be the next profession to insist on a recognised status and a legal qualification.

THE TEREDO NAVALIS IN BOSTON HARBOUR.

At a late meeting of the Boston Society of Civil Engineers Mr. Henry Manley said:—The Eastern Dredging Company has two large scows built last season of pine, which were brought to Boston, where they were measured. They were taken down to the mouth of the harbour, beyond Boston Light, on or about May 27, for dredging, and were used there during the summer. In October or early in November they began to leak, but by that time the owners had begun to suspect that something serious was the matter, and the one in the worst condition was brought up the harbour. It was found pretty thoroughly bored through by teredo navalis, and had to be practically replanked. Another scow was then brought up, and was found riddled through, though not so badly, by the teredo. The teredo has for a long time existed on the southern coast of New England; but the harbour, on account of the difference in the temperature of the water, was supposed to be exempt. This case is almost the first in which they have been found so far north, and is the first in which they have done any appreciable harm. There are some curious features in the life and nature of the teredo. The full-grown animal sometimes attains a length of 2 or 3 feet. It enters the wood through a very small hole, and after that passes its life inside, penetrating the wood as it grows, but living in one sense a solitary life, as the openings never communicate with each other. The eggs are formed in the interior of the animal in position, and are fertilised there. They are hatched in the water. While the animal is in the water it passes through two or three different stages of growth, in each of which it assumes a different form. In one stage it is able to swim. In a later stage it has a foot that enables it to cling to any object and to move about to a limited extent. It enters the wood when about as large as the head of a pin. After it makes its entrance into the wood its progress is quite rapid. The 4 or 5-inch plank shown has been torn to pieces during one summer. The teredo does not eat the wood, but simply bores it out for a habitation. It has two flues or

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

THE INCANDESCENT GAS LIGHT CO., LIM

14 Palmer Street, Westminster, London.

passages running the whole length of its body and opening out into the salt water. Through one passage it takes in the salt water with the infusoria, &c., which constitute its food, and through the other tube the chips, its own excreta and everything else it wishes to get rid of are passed out into the water. The animal is technically a bivalvular mollusc. Its boring apparatus is a very curious one. The two large shells are not firmly hinged together. Indeed, in the specimen shown they seem to be quite loose from each other, but judging from the amount of work it can do in one season they must, in the living animal, be connected by very powerful muscles. The instance recorded may be an isolated one, or it may be the beginning of a terrible pest that will cause great trouble for all time to come to those who have charge of submarine woodwork in Boston harbour. Among the preventives in common use, covering with copper and creosoting are the most effectual. Creosoting is valuable only for a certain number of years.

WHITWORTH SCHOLARSHIPS.

THE following is a list of candidates successful in the competition for the Whitworth Scholarships and Exhibitions, 1894 :—

SCHOLARSHIPS (tenable for three years).—John Ball, James I. Smith, Harry Verney, Charles F. Smith, 150*l.* a year each.

EXHIBITIONS (tenable for one year).—Frank Fisher, William M. Thornton, John W. Hinchley, William D. Young, Alexander L. Mellanby, William T. F. Trunchion, Henry Deanesly, William T. Swinger, Arthur W. Ashton, Arthur E. Mascall, William Rosbotham, Joseph J. Kirwin, Charlie W. Cairns, John W. Button, Sydney Eraut, Charles E. Pickles, Richard G. Allen, Alexander Craig, Thomas S. Usherwood, Walter Eraut, Lewis E. Limming, Sidney E. Lamb, Francis J. Russell, Edgar R. Sutcliffe, George F. Hambly, William Gore, Thomas S. Cockrill, William H. James, Henry J. Peachey, James N. Boot, 50*l.* each.

ARCHITECTS AS TOWN COUNCILLORS.

AT the meeting of the Eastbourne Town Council on Monday the following conversation, according to the *Sussex Daily News*, formed part of the business.

Councillor Foran asked whether, on plans being passed

subject to the condition that a building would not be occupied as a dwelling-house, it was anybody's duty, and if so whose, to see that the undertaking was carried out ; and, further, whether the undertaking was always strictly carried out ?

Councillor Towner replied that it would be the duty of the building surveyor to see that the condition was carried out, but he was afraid it was not always strictly adhered to, because he knew that from time to time places had been inspected and reported upon without any action being taken upon the report. He would, however, bring the question before the buildings committee at their next meeting.

When the minutes of the buildings committee came up for consideration, Councillor Towner called attention to the fact that some plans of his were passed subject to the undertaking, and said that he did not intend to give it, as although the premises were simply intended for business, if he wished to put a caretaker in he should do so.

Councillor Bennett : I rise to a point of order.

The Mayor : What is the point ?

Councillor Bennett : He is talking about his own affairs.

Councillor Towner : I cannot speak of anything better.

The Mayor : I think you are out of order.

Councillor Mitchell said he would like to take up the same subject.

The Mayor : You are out of order ; you are the architect.

Councillor Mitchell replied that he was not speaking of Councillor Towner's plans, but of Messrs. Strange & Atkinson's, who had given an undertaking that a building for which they submitted plans should not be occupied as a dwelling-house. This undertaking was simply a farce. The Town Council had just the same powers whether the undertaking was given or not.

Alderman Morrison thought it exceedingly wrong of Councillor Mitchell to suggest in the absence of Alderman Strange that anything the alderman put his hand to was a farce. Anything Alderman Strange did ought to be sacred, to say the least of it.

The appearance of Alderman Strange just at this moment drew a laugh from the Council.

Councillor Bennett raised the question of the committee's refusal to sanction Mr. Oakden's plans for the erection of shops and offices on ground adjoining No. 10 Cornfield Road, and Alderman Strange stated that an undertaking was given some time ago that the ground should always be kept as air-space.

Councillor Bennett urged that the agreement between Mr. Gausden and Mr. Oakden was that shops should be built there.

Alderman Strange denied it, and Councillor Bennett characterised the alderman's denial as false, whereupon he was promptly called to order.

Alderman Homewood remarked that the undertaking seemed to be demanded in a great many cases.

Councillor Breach asked whether it would not be as well to insert the words "except to a caretaker"? He also contended the undertaking was a farce, as in Terminus Road at the present time there were premises occupied in respect of which the undertaking had been given.

SOUTH DEVONSHIRE.—A NEW DEVELOPMENT.

AMONGST the many introductions of modern times to combine business with pleasure, perhaps there is nothing that has effected a greater revolution than the system of disposing of land of a moderate area to enable the middle-class capitalist to be his own landlord at some charming inland resort, or in view of the sea at a rising watering-place. It is a practice perhaps as "old as the hills" for land agents to announce that at public sales "refreshments will be provided on the ground," and the writer is old enough to remember that even at our ancient sales at Garraway's in Cornhill, coffee and muffins were gratuitously handed to all who possessed a catalogue.

But it has been reserved for Mr. F. G. Wheatley, F.C.A., of Poole and London, to organise excursions to the far West, that possible buyers may invigorate and brace up their physical and mental powers, inspect some of the charms of Devonshire, and then sit down under the presidency of a judicious auctioneer to purchase what they, as the investing public, have carefully inspected and mentally approved.

Such an excursion we took part in recently, and as we were buyers of one or two plots eligible for a bijou residence, and have no pecuniary interest in the success of the sales, it may not be uninteresting to our readers to have a few details of this excursionary exploit. Salcombe, located at the extreme south of Devon, has recently been brought within measurable distance of a railway station through the extension of the Great Western Railway to Kingsbridge, but it is intended at an early date to continue the line to the former place.

Its surroundings are perhaps the most charming of South Devonshire, combining picturesque scenery of luxuriant foliage

and varied slopes teeming with vegetation with the bold scenery of an estuary of the English Channel. This latter feature perhaps is the most tempting characteristic to Londoners, more especially as the climate has been proved to be health-promoting, with a temperature remarkably equable.

By the invitation of Mr. Wheatley about sixty gentlemen and a few ladies left Paddington on the 27th ult. by the 11.45 express in reserved saloon carriages, and reached Kingsbridge about 6.30 P.M. Accommodation was provided on a liberal yet homely scale at the King's Arms hostelry, and on the following morning the party, enlarged by contingents from local towns, drove to the outskirts of Salcombe, a distance of five miles. The estate, a part of which is already laid out for building sites, was until recently the property of the Earls of Devon, and was purchased by the South Devon Land Company, of 263 Strand, W.C. The lots were freely bought by the excursionists, and, if we may judge from similar sales, the sites realised what we should deem fair business prices; certainly the purchasers were satisfied that they had obtained plots of most charming position, and that they had secured full value for the amounts invested.

We did not recognise many Fellows or Associates of the Institute or of the Association amongst the company, but we are of opinion that any one of our readers might do worse than take an interest in this new marine resort. It is for this reason that we give prominence to Salcombe, knowing that architects are often asked to advise their clients as to the eligibility and advantages of our many English watering-places for health, comfort and recreation. After business was over the company had ample opportunity to enjoy sails round the numerous headlands and the lovely bays that so specially characterise this romantic spot; others indulged in the luxury of a bathe or the delights of a country ramble. The return journey by coach or chaise gave a zest for a well-spread dinner, and the party returned to town by a midday train on Wednesday.

It was mentioned by Mr. Wheatley that a second sale of the company's property would take place on or about the 27th inst., and as the cost to the probable purchaser is nominal, some of our clients would probably find it to their interest to join the next party, especially as at Kingsbridge, where they would stay, there are several old buildings and other archaeological features that are of historic interest.

We should add that Salcombe is located between Torquay and Plymouth, is bounded by the Dartmoor heights, and has a dry rocky subsoil.

OLD GATEWAY, SAN REMO.

GARDEN ENTRANCE.

SANKEY'S "DEEP" INTERCEPTING GULLEY.

WE have received a model from Mr. J. H. Sankey of his excellent improved gulley and interceptor. Mr. Sankey claims that no other gulley contains so many advantages as his, and it is hard to see what more advantages it could have. It must prove a most useful and sanitary appliance from the principles of its construction, and a great boon from its securing perfect cleanliness, without which a gulley can neither be sanitary nor useful. The employment of Mr. Sankey's gulley will save all the annoyance of having to break up drains to get at a choked-up and foul trap to cleanse it. It will be seen from the engraving that it is most effectual in trapping. It is a deep narrow circular gulley of glazed stoneware, with a deep perforated metal bucket with lifting handle for catching detritus, and the trap seal is so unusually deep that it is impossible for it to unseat even in the driest weather. The construction is perfectly simple. The bucket is of galvanised iron, and it intercepts small stones, dirt, sand, rubbish, fat, grease, &c. The bucket is easily removed at any time, and the gulley does not untrap when the bucket is withdrawn. Tipping buckets are supplied with the largest sizes, which are specially suited for road and street purposes; these buckets can be removed by a small hand crane fixed at the back of the collecting cart, and the mud and other muck tipped direct into same, which is a great saving of labour on the old and present offensive way when muck is scooped up on to the road and then thrown into carts. The inspection-cap gives ready access to drain and gulley,

and if either should require cleaning the process must be most simple.

Stoneware kerbs of various patterns are made with lip to fit in socket of Sankey's improved gulley, with specially strong stoneware and iron grids to fit. Kerbs for the larger sized gulleys are made in segments. Hinged grids and locking grids for schools are made to order. Special iron frames and grates are supplied for stable, road and other purposes. A special

channel for fitting on to ordinary kerb, to carry waste water from house, is specially constructed to meet the requirements of the Board of Works. These do not take up so much room as others where kerb and channel are made in one piece. These stoneware goods are of exceptionally good material, strong, well glazed and finished.

The patent has only lately been completed, the gulley being a recent introduction, but one which is taking well and giving great satisfaction where it is used. The gulleys are made in various sizes and are suitable for nearly every purpose—household, stables, yards, factories, hospitals, roads, streets, playgrounds, schools, &c. Various tops and gratings are supplied for the several purposes, and a large stock is kept in London. Mr. Sankey has now just granted licenses to the following firms (manufacturers):—Messrs. Hexter, Humphersen & Co., of Newton Abbot, Devonshire; The Albion Clay Co., Woodville, near Burton-on-Trent. Both these firms are noted for

NEW CATALOGUES.

WE have received from Messrs. Smith & Co., of 45 Oxford Street, Manchester, their new illustrated list. An "Illustrated Catalogue of Mathematical and Drawing Instruments" is the very modest title of this list, which includes pretty nearly every article and instrument required by architects, engineers and surveyors. It is a thick volume, comprising over 120 pages. As an instance of the contents, it may be mentioned that a draughtsman's requirements are consulted to the smallest minutiae—pencils, brushes, drawing paper, sketching blocks, drawing pins, oil and water-colours, chalks, portfolios, &c., not to mention instruments of every kind, compasses and sets of some dozen varieties, protractors, graduated scales of all kinds, clinometers, pentagraphs, planimeters, centrolineads, &c.; also squares of every diverse kind in use. Architects, surveyors and engineers are, or have been, necessarily draughtsmen, and the reference above given to suggest, in a small way, the exhaustive manner in which Messrs. Smith & Co. are prepared to meet their wants as draughtsmen must be taken as an indication of the complete arrangements made by the firm to suit every other requirement of professional men, not only for instruments, but for small and detail articles. One of the most interesting of occupations is that of the surveyor. However fascinating is the work of an architect or an engineer, they cannot dispense with the surveyor, except by combining his work with that of their own profession. Executed architectural and engineering works are a standing monument of the author's skill, but the surveyor's work is practically a hidden work. No visible record remains of his work with theodolite and chain. Levels are taken, mountain ranges pierced, rivers burrowed under, working from both ends to meet with mathematical accuracy. But the instruments required by surveyors are numerous—sextants, magnetic compasses of different kinds; ordinary, prismatic, sight and combination compasses; in smaller matters, measuring tapes, chains; also levels, aneroids, &c. If we have in these short remarks interested our readers, we trust they will consult for

themselves the catalogue which Messrs. Smith & Co. are prepared to forward on application. While maintaining the high finish of their instruments, we understand that the prices have been carefully revised to bring out the goods as far as possible at a reduced price.

REGISTRATION OF PLUMBERS.

THE sessional report of the Ayrshire Plumbing Class has just been issued, being that of the first session—February to June, 1894—of the Glasgow and West of Scotland District Council, National Registration of Plumbers. The class—in support of which a grant of 100*l.* was, in the end of 1893, promised by the County Council of Ayrshire out of the technical education moneys at its disposal—has been conducted in accordance with the scheme which, after holding a meeting at Ayr and communicating generally with the trade throughout the county, this Council, which acts in co-operation with the Worshipful Company of Plumbers, London, proposed to the County Council on January 24 last. In carrying out the scheme the Council have received great and indeed indispensable assistance from a large and representative local committee of master and operative plumbers. With the approval of the governors of the Glasgow and West of Scotland Technical College, the class was at its formation affiliated to that body, and from it the lecturer derived his formal appointment.

The class met in Carrick Street Mission Hall, Ayr, on Friday evenings at 6.15. The first meeting took place on February 16 and the last on June 15—in all twenty meetings. The fees for the course were for journeymen 3*s* 6*d.*, and for apprentices 2*s* 6*d.* It was also arranged that students attending from other towns than Ayr should have their fares (third class return) repaid to them on condition that they should make out not less than three-fourths of the possible attendances, and that they should present themselves for such examinations of the class as should be arranged. The total number of students matriculated was ninety-seven.

The lecturer was Mr. Alexander Dalrymple, Assoc. San. Inst., registered operative plumber, Ayr, who had the advice and co-operation of Mr. J. L. Arnot, registered master plumber, Glasgow. Mr. Arnot frequently met with Mr. Dalrymple and visited the class eight times. The nomination of these gentlemen proceeded from the local committee, and it is satisfactory to report that the arrangement has worked well. Mr. Dal-

rymple has displayed a grasp of his subject and a facility of exposition which is deserving of all praise, while the practical experience and guidance of Mr. Arnot have proved most useful.

The district council are pleased to learn that with the view of still further equipping himself as a lecturer on plumbing, Mr. Dalrymple proposes to undergo an advanced course of training in the autumn months in London, which the Worshipful Company of Plumbers have agreed to provide free of charge.

The scheme of instruction was that of the ordinary grade of the City and Guilds of London Institute, and dealt with the properties and qualities of lead, tin and zinc, white and red lead, solders and their composition, fluxes, &c., geometry as applied to plumbing, external plumbers' work, &c., varieties of traps, soil pipes, materials and construction of drains, water supplies, cisterns, &c., water-closets, &c. In another session it is intended to have a course in the honours as well as the ordinary grade.

In connection with the class a public lecture, illustrated by limelight views and model apparatus, was delivered by Professor John Glaister, M.D., D.P.H. (Camb.), St. Mungo's College, Glasgow, in the Town Hall, Ayr, on Tuesday, March 6, on the subject of the "Sanitation of the Home." Mr. C. G. Shaw, county clerk of Ayrshire, presided, and there was a large attendance of the trade and of members of the public interested in sanitation and good plumbing.

Arrangements were also made for two class excursions taking place on Saturday, May 12, viz.:—(1) A visit to Messrs. T. B. Campbell & Sons' Leadworks, Cornwall Street, Glasgow, at 10.30 A.M., and (2) a visit to the Glasgow Corporation new sewage works, Dalmarnock Road, at 3 P.M. Over ninety of the students took part in those excursions, and they were accompanied by a considerable number of their employers. The inspection of the leadworks lasted for nearly two hours, during which, under the guidance of Mr. David Campbell, the party had the advantage of seeing in operation the various processes of lead manufacture, including lead rolling, drawing of lead pipes and block tin gas tubes, and the making of red lead. At the new Glasgow sewage works, the party, under the guidance of Councillor King and the manager of the works, were conducted over the entire ground, and had fully explained to them the various processes for converting the contents of the sewers into a pure effluent, and removing the sludge in the ultimate form of solid cakes. The district council were successful in obtaining from the Glasgow and South-Western Railway

Company the privilege of a uniform reduced fare from all parts of the county for this excursion.

The closing lecture on June 8, which was made a public one, was delivered by Mr. Dalrymple before a large and appreciative audience composed of members of the trade and those who have taken an interest in the movement. Mr. Samuel Cowan, chairman of local committee, presided, and at the conclusion the class was addressed by County Councillor Smith, Prestwick, Mr. Morgan, of Ayr School Board, and by Mr. W. P. Buchan, Mr. Arnot, and other members of a deputation from this Council.

The Council and local committee had in view, as part of the scheme, that the students should go forward to the examination of the City and Guilds of London Institute of this year, but it being afterwards found that those examinations were fixed to take place all over the kingdom on May 2 (up to which date the Ayrshire class had only received eleven lectures), it was felt that it would be unfair to all parties this year to attempt an examination for which the normal course of instruction is twenty-five lectures. At the conclusion of the class, however, the examiners of this Council undertook, at the request of the Technical College, to examine the class. The examination took place, by the kind permission of the Ayr School Board, in the Ayr Academy on Friday, June 15.

The following is a copy of the examination paper:—

1. Sketch and figure dimensions of a cistern to hold 100 gallons. What would be the weight of water in same? And say what weight lead, per foot super, you would use to line the cistern with?

2. What weight of solder would be required for the above cistern, and what would be the total weight of the lead, allowing $1\frac{1}{2}$ inches all round the top edge? Show how you would set out the lead for the above cistern, figuring the dimensions on sketch?

3. What size main would you fix to such a cistern (a) if for constant supply, (b) if for intermittent? Assuming the cistern to be 50 feet above the lowest fitting, what would be the pressure in pounds per square inch at the lowest end of the pipe?

4. Sketch or describe a "wash-down" closet, and show how you would arrange the branch soil-pipe to same. What connection would you make between the lead soil-pipe and stone-ware drain?

5. Sketch, full size, a 2-inch wiped joint, showing and describing the preparation of the same. How much solder

WINTER, WARMTH & COMFORT.

PURE WARM AIR, as Supplied to

uro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; ardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of ree thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouses, Factories, Workhouses, &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that it as proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus nabled to spend my winters in England instead of on a foreign shore,—Yours very truly,

JOHN TYNDALL.

Dr. GRIEVES says:—

Buckhurst Manor, Wadhurst.

I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. I ould not like my house warmed with any other method, for I like plenty of ventilation and do not approve of stagnant air.

Book of Testimonials gladly forwarded gratis on application to

JOHN GRUNDY,

And TYLDESLEY, NEAR MANCHESTER.

Telegrams:—"JOHN GRUNDY, LONDON."

would be required to make this joint, what tools would be used, and what would be the proportion of tin and lead in the solder?

6. Why does the tin sink to the bottom part of the joint? Assuming the solder to be burnt, what will be necessary to render it fit for use?

7. Sketch two traps in position which in your opinion would be most easily syphoned out, and suggest the remedy.

8. A hot-water tank, 2 feet by 2 feet, is fixed 20 feet below the cold-water cistern and connected with a 1-inch pipe. What is the total pressure on the bottom of tank?

9. What description of drain-pipe would you use in the vicinity of a drinking-water well; how would you join it; and what precautions would you take to avoid settlements?

10. Show the section of a rain-water cesspool with drip, gutter, and rain-water pipe.

11. Show plan of how you would cut and set out the lead for the above cesspool ready for soldering. Describe the weight of lead per foot super that you would use.

12. Name and describe four generally recognised causes of kitchen range boiler explosions, and the remedies for the same.

It is intended to distribute the prizes in the beginning of next session, and the Company of Plumbers have intimated that, with the object of marking their sense of the satisfactory result of the opening and working of the class, they will give prizes consisting of suitable text books, bearing the Company's arms, to the nine students mentioned in the examiners' report.

But for the enlightened action taken by the County Council, the Ayrshire plumbing class of the past session would have had no existence, and the hearty thanks of all concerned are due to them. As regards the future, it is clearly very desirable that an educational movement, which has so direct a bearing on the health of the community, and which has been taken up with so great enthusiasm by the trade, should be maintained. It has been the aim of those directing it to keep down expenditure in every way; but the formation of a practical workshop, such as that which has been fitted up in Glasgow Technical College, is much wanted. Such an undertaking would probably require a capital outlay of about 100*l.*, while there would be an annual expenditure of at least 20*l.* or 30*l.* on instructor's salary and materials. The District Council, therefore, combine with the local committee and the plumbing trade of the county in making an earnest appeal to the County Council to renew, and, if possible, to increase the grant.

PROVINCIAL BUILDING REGULATIONS IN SCOTLAND.

A PAPER on "Building Regulations in Counties" was read by Mr. W. Kelso at the Sanitary Congress in Glasgow. He said it was a no less unfortunate than it was a regrettable fact that the counties of Scotland were still, so far as statutory building regulations were concerned, exactly where they were years ago, and were only in a position to practise sanitation of the old curative or remedial class. Of course it might be said that building regulations, as applicable to counties, did not necessarily require to deal with such a variety of details as those for towns, and that was at once admitted. But the necessity for building regulations to secure proper drainage and sanitary erection of new houses appeared to him to be as great in counties as in towns. The genus "jerry or speculative builder" and his *modus operandi* were much the same wherever he was to be found. As a rule, his first and only consideration was to "run up" buildings without the least regard to stability or the health of those who were to occupy them. Nor was the want of care and attention to sanitary details by those primarily responsible for design and arrangement an unknown thing. It was clear that what they sought to guard against could only be done by statutory regulations which would place the proper authorities in a position to say that certain rules must be observed. Under the circumstances the official could only stand by and await the existence of nuisance. One might almost build anywhere and in any way in the counties, and the sanitary authorities were powerless to prevent it. New houses were thus frequently not many weeks or months occupied till there were complaints of illness or enteric fever or diphtheria, ending in what must be regarded as preventable death. After disease had made its appearance the sanitary inspector, in his present capacity of the curative or remedial official, came in and the cause was found. Was that not something like paying for original sin? The sanitary regulations for new buildings contained in the Burgh Police (Scotland) Act, 1892, could be easily made applicable to the counties with such slight alterations or modifications as might be deemed necessary, and would, he felt sure, prevent in the future the growth and occurrence of those painful and disheartening scenes and experiences to which the earnest county official was not a stranger. It appeared to him that nothing could savour less of class legislation than building regulations. Our sanitary system would be very incomplete and imperfect until that had been effected. Who, he asked, could say that the evil effects which had been

steadily growing for years owing to the want of building regulations were not to be found in the county residences as well as in the cot, and the troubles which might be caused thereby were no respecters of persons?

Mr. Lindsay contended that the local authority should have the entire control of the sanitary regulation of buildings. Something in that line and not so strong as a Dean of Guild Court, he thought, would have some reasonable hope of passing.

Professor Hay moved:—"That owing to the continued erection of dwellings which are not in accordance with modern sanitary standards and which later on will have to be made sanitary, if at all practicable, at much cost and with great difficulty, this congress is again unanimously and strongly of opinion that power should be given without delay to all local authorities to adequately regulate the construction and surroundings of new buildings."

Mr. G. Thompson, said that the need for regulations was by no means confined to the poorer dwelling-houses. Some of the very largest and most aristocratic dwellings were grossly deficient in sanitary arrangements. There was a great need for elasticity in the regulations. Drainage details, after all, were matters of great difference of opinion.

Mr. Steel said that unless they had a court which would insist that sanitary regulations and requirements would be observed in the laying-out of buildings, the efforts of the sanitary officer would be useless. It was well known that if a sanitary inspector came on to the ground and proposed a great amount of structural alterations on a building, he was met by the proprietor with very serious objections because of the large amount of expenditure which would be incurred. The expenditure would be minimised to a great extent if there were some central authority to take up and sanction all buildings that were being erected. Without that he feared a great deal of the work of the sanitary inspectors throughout the country would be handicapped, and they would be frustrated in their efforts to get the sanitary surroundings which were so desired. He thought that in the appointment of such a court some one should be responsible who knew what buildings were, and that the sanitary inspectors in the district should be represented in that court.

Mr. James Chalmers said that they were all agreed as to the necessity of building regulations. There was a resolution before the congress, but he was prepared to go a step further. He moved:—"That it be remitted to the council to draft a

series of clauses which are adequate to meet the existing evils connected with buildings, including the sanitary requirements, in rural districts."

Both resolutions were adopted.

PROPOSED YORKSHIRE WATERING-PLACE.

A SCHEME which has for its object nothing less than the creation of a new watering-place on the Yorkshire coast is now, says the *Leeds Mercury*, in course of preparation. The situation is all that could be desired, and the conditions generally are calculated to excite a good deal of confidence as to the result of the enterprise. Those who have visited Filey know that in the vicinity of the railway station there is a gentle descent to the beach, embowered by trees known as the Ravine. This is the northern boundary of Filey. Extending northwards are the lofty cliffs reaching to the far-famed Brigg. It is between these points that it is proposed to build the new health-resort. Those acquainted with the locality may think that the undertaking would be more correctly described as an extension of the existing town. But, as will be seen, it is something else than that. There will be contiguity, but little more. The promoters contemplate the creation of a watering-place complete in itself. They further intend that its attractions shall surpass those of Filey and rival those of any other health-resort in the country. This they hope to achieve by retaining full control of the enterprise, and, after making a tour of the most popular seaside resorts, more particularly in the south, by adopting what they find in their travels most desirable. It is an ambitious venture, and the carrying it out will entail the expenditure of a large sum of money; but the details of the project, which have been under consideration for a considerable period, are well matured, and there is no lack of confidence either as to the feasibility of the scheme or as to the possibility of carrying it out successfully.

The natural beauties of the locality have sufficed to give Filey an enviable reputation amongst the watering-places, not only of the north, but of the country generally. Commanding a view of a beautiful sheltered bay, where boating may be enjoyed under safe conditions, the place is picturesque, restful, salubrious. It is preferred for the quietude it affords. The tripper scarcely troubles it at all. Its hard, level sands, extending from the Brigg to Speeton Cliffs, a distance of seven miles, are another of its charms. The Brigg, where white-crested

COOPER'S Patent

"ACME" VENTILATOR & CHIMNEY TOP.

(Patented in England and Abroad)

In introducing this, the latest improved form of Ventilator, we have every confidence that it is the most powerful, effective and reliable in the market. It consists of a number of shields, which are riveted to a common axis and so arranged that they cover up in a radial manner the whole of the opening at the top of the air shaft, space being left between the edges of each shield. By this means, whether the wind descends, ascends, travels obliquely or laterally, it creates a continuous and powerful up current. As a Chimney Top it will be found certain and perfect in its action for preventing down draught, and a powerful agent for increasing an up current in the chimney flue.

Advantages of the "Acme" Ventilator and Chimney Top.

No. 1.—It is a fixture, has no mechanical movements, cannot get out of order, requires no attention, and when once fixed there is no after cost.

No. 2.—The area of the openings between the shields being twice as large as the area of the air-shaft allows a free discharge of vitiated air.

No. 3.—The slightest wind, no matter from whatever quarter, will create an up current.

No. 4.—It is not only the most effective Ventilator and Chimney Top before the public, but is also the cheapest in the market.

Architects are invited to specify
Cooper's Patent "Acme" Ventilator
and Chimney Top.

Prices and full particulars on
application.

Sole Patentee and Manufacturer:—

GEORGE COOPER, ELECTRIC WORKS, SHEFFIELD.

(Established 1848.)

waves are usually to be seen dashing against the rocks with majestic grandeur, to be broken into masses of white water, is the first resort of the newly-arrived visitor. When the delights of the shore begin to pall, there are the numerous pretty drives inland. Should something more stirring be desired, a journey of nine miles in one direction will take the visitor to Scarborough, and one of fourteen miles the other way will land him at Bridlington. It would be an exaggeration, however, to say that the little town offers all that the class of visitors it attracts might reasonably desire. Climbing the steep cliff from the shore demands more exertion than even the most robust find to be agreeable, while to the weak it is, to say the least, a severe tax upon their energy. Now that the attractions of the shore have been materially enhanced by the construction of a fine promenade along the new sea-wall, the want of some easy and inexpensive means of conveyance to and from the beach is felt all the more. Filey would also be greatly improved by the construction of a pier, for, after all, there is little that is more attractive to inland people than the sea. The public gardens on the cliff are a pleasant retreat, and the music of the small band of instrumentalists in the season is also entitled to be taken into account; but here, too, there is scope for improvement. In saying this, however, it must be admitted that Filey, which during the present century has risen from a mere fishing village to the position of a first-class watering-place, has done much to afford her visitors enjoyment, and enough to show that, if her resources were greater, more might be expected at her hands.

The promoters of the scheme under notice hope to be able to supply what they regard as deficient in Filey, whilst laying the foundations of what they intend shall be in all respects a model watering-place. They do not propose to form a company for the purpose, but a syndicate which shall number not more than twelve parties, and probably will not exceed six. The land involved in the scheme, extending, as already explained, from the Ravine to the Brigg, comprises about three hundred acres, with two miles of sea frontage. This is the property of Mr. H. B. Firman, of Gateforth Hall, near Selby, who is the lord of the manor, and the owner of considerable more land in the locality. He is taking the leading part in the enterprise, and some of the other members of the syndicate which is now being formed will be contractors, who will be equal to carrying out the greater part of the works. The architect and engineer is Mr. W. G. Penty, F.R.I.B.A., of York, and he is now engaged in preparing the plans. The

solicitors are Messrs. Haigh, Son & Thompson, of Selby, and they are busily engaged with other preliminaries. The scheme comprises the construction of a sea-wall from the Ravine to the Brigg, a distance of more than half a mile, thus forming a continuation of the sea-wall which was completed a few months ago. As in the latter case there will be a spacious parade behind the wall, and the picturesque valley called Horndale, some two or three hundred yards from the Ravine, will be transformed into public gardens and a spa, there being a mineral spring of saline and chalybeate water in the vicinity. Two streams on the estate will, in all probability, be brought through Horndale in order to enhance the attractions by the introduction of waterfalls. When completed the parade, gardens, &c., will be more extensive than those of Scarborough. The accessories will comprise a band-stand, and probably also a large concert-hall. The construction of a tramway from the top of the cliff to the beach is now under consideration; and the plans will show an iron pier running into the sea some 1,700 feet, considerably below low-water mark. In laying out the estate, a large portion of the land nearest the cliff will be reserved for villas and bungalows. Behind these will be the town proper, and here the streets will be about 70 feet wide, laid out in the Continental style, with lines of trees and flower-plots. Fountains are to be placed at points where the streets cross each other, and at the corners will be more flower-beds. Nothing is to be done to disturb the quietude of the place; the tripper will be discouraged at all points, but obviously it will be impossible to maintain the simple character of Filey. It must become more fashionable, and some people, no doubt, will regret the change. As already mentioned, the syndicate intend to keep the control of the enterprise in their own hands, and hence their proposal to build summer residences on the estate to order. No jerry-building will be tolerated, and the greatest care is to be taken to insure thorough sanitary arrangements. The syndicate will be advantageously situated in being able to obtain clay, stone, lime and sand for building purposes on the estate. A building has already been erected with such materials so acquired. Eventually companies will most likely be formed to take over the pier, parade and cliff tramway.

The plans are nearly completed, and it is expected that operations will be commenced early in the spring of next year. The first work undertaken will be the construction of a sea-wall, but it is at present proposed to proceed by sections. Until the estimates are completed it is difficult to say what amount of capital will be required, but it is believed that the

carrying out of the scheme will entail an expenditure approaching a million sterling. It is not proposed, however, to ask the public to subscribe; it is intended that the members of the syndicate shall provide the whole of the capital.

THE BLACKWALL TUNNEL.

THE operations at the Blackwall Tunnel are now approaching the point at which the work will have to be carried on actually beneath the bed of the river. Some delay, says the *Daily News*, has been occasioned by the cutting edge of the "shield" by which the tunnel is actually bored having been bent by contact with a mass of rock. That has now been repaired, and progress is about to be resumed with the subaqueous portion of the tunnel. This mishap to the shield has not, of course, hindered the advance of the river bank portions of the work. On the Middlesex side of the river about 700 feet of the open approach to the tunnel has been finished, and the second of the two shafts which on this side will give access to the tunnel below for foot passengers has been got down to a depth of 33 feet by means of crane and grab. On the south side of the river the work is considerably more advanced. There will here be a length of 1,000 feet of what is technically called "the cut and cover" portion of the tunnel—the portion, that is to say, which is not bored out underground, but for which an enormous trench is cut, the tunnel built in it in the ordinary way, and then covered in. Of the thousand feet just about three-parts has been finished. On both sides of the river all the property standing in the line of the tunnel and its immediate approaches has been demolished, and the new dwellings for the people disturbed, as required by Act of Parliament, have been set up, and for the most part are occupied.

In these land portions of the tunnel there is nothing very exceptional in the work unless it may be in the magnitude of it. From end to end, including approaches, the length will be 6,200 feet, considerably over a mile, and the tunnel, of which 750 feet has now been completed and covered in, is a huge circular gallery, 24 feet 3 inches in diameter. But the work of real difficulty is now about to commence with the under-river portion of the tunnel. The boring by means of the great circular drumhead—the "shield"—weighing 250 tons, with a sharp cutting edge in front, and at the back of it twenty-eight hydraulic jacks, each shoving with the force of a hundred tons,

has already been in progress on the southern margin of the river, where it has been necessary, in order to keep out the water, for the men to work under compressed air. They have had 120 men working in three shifts under an air pressure of 24 lbs. to the square inch over and above the normal pressure of the atmosphere. This was carried on for two months, and in some twenty cases men were more or less injured by it, three or four of the men proving so especially susceptible to injury that it was deemed advisable to discharge them. Different men it appears to affect in different ways. The commonest symptoms are what the men themselves describe as "tooth-ache in all their bones." In some it produces violent pains in the pit of the stomach, and in extreme cases it paralyses the lower limbs. The London County Council have adopted a scheme by which men injured in the course of this air-pressure work will receive compensation, and some provision will be made for their families in case of death or permanent disablement. Arrangements are also being made to have a medical man resident on the works. One curious experience of men working under any pressure above about 10 lbs. to the inch is that they cannot whistle, and another is that all their voices are curiously raised in pitch, so that a man with a deep bass voice finds himself talking in a high tenor or alto. It is said, however, that the thinness is largely compensated for by the strength of the adjectives. Experience thus far has shown that the air-pumping appliances will have to be materially increased. They are ample for insuring the required pressure theoretically; but, as a matter of practical experience, it is found that the loose, pervious nature of the earth forming the margin of the river bed permits a certain proportion of the air to blow through, and the pressure is thus reduced. Messrs. Pearson & Sons, the contractors, are therefore preparing to double their air plant.

The injury to the shield has been repaired, and it is now about to resume its burrowing on its gloomy and perilous way right across the river. The first 600 or 700 feet will, it is hoped, present no very serious difficulty. Borings have shown that for this distance the tunnel will have the benefit of a thick bed of clay overhead. This will, of course, diminish the liability to an influx of water from above. On emerging from the shelter of this stratum of clay, however, the tunnel will have to make its way beneath a river bottom of loose earth, shingle and sand, and this part of the undertaking will probably give the contractors the most serious anxiety, though of course their whole passage under the river will be beset with risks with

which engineering science when the Thames Tunnel was built would have been powerless to cope. What they have to do here at this Blackwall Tunnel is to burrow under the river, which at high water is 47 feet deep at this point, with only about seven feet of earth between the soffit of the tunnel and the water above. Even Brunel, with all his audacity, would have shrunk from such a venture. Indeed, apart from Mr. Greathead's system of tunnelling such a feat would be wholly impracticable. This system has now been adopted in many works with complete success, but it has never yet been tried on the same scale. No "shield" has ever before been built for the boxing of a tunnel 27 feet in diameter. However, the thing will no doubt be done, and Mr. Moir, who represents the contractors on the work, and who successfully carried out a large portion of the Hudson River Tunnel, seems to carry a tolerably light heart, and so do the two County Council engineers, Mr. Hay and Mr. Fitzmaurice, representing Mr. Binney, the Council's chief engineer. As one means of reducing the peril of a great influx of water when the boring emerges from under the existing clay bed, it has been determined to throw down a covering of clay over the river bottom. The Thames Conservancy have just authorised this, stipulating however that this covering shall not exceed 10 feet in thickness. The contractors would have liked a thickness of 15 feet, but this, it is objected, would possibly interfere with the passage of shipping up and down the river. No less than 15,000 cart loads of clay will be required even for the 10-feet covering, and the cost will be some thousands of pounds.

SANITARY PLUMBING.*

A GREAT deal has been written and said of the terrible havoc made from time to time through the agency of defective plumbing-work in Great Britain and America, and in most cases the cause has been attributed to the plumber without proper inquiry, forgetting or ignoring the fact that he (the plumber) was entirely guided by the specifications, which, in the majority of cases, were framed on false economy, and very often ignorance of the subject by the architect. I am now speaking of what I know from experience. As a sample, an

* A paper read before the Associated Master Plumbers of Victoria by Mr. F. B. Brady, master plumber, on Tuesday, July 10, 1894, and published in the *Australasian Builder*.

architect specified (where the owner would willingly pay for good work) a 4½-inch cast-iron rain-water pipe with red lead joints for vertical soil pipe from three water-closets, and to make matters worse, had it fixed in a recess in wall. When remonstrated with he said, "Carry out the work as specified, and I will accept all responsibility." I merely mention this as an instance of how the plumber is blamed for defective work when the specifications distinctly give him material to use which renders it impossible to make the work secure for any length of time, and then the architect is the first to fix the blame on the plumber. I sincerely trust for the sake of all concerned that the architects of this colony will have all fixed rules and data at their fingers' end, so that incompetent and unscrupulous persons may be prevented from undertaking the execution of work which they do not understand. I consider every architect should be sufficiently instructed in plumbing to know the difference between good and bad work in course of construction, not after.

Too little attention has been given in the past to this important (to my mind the most important) work in a building; hence the great trouble afterwards. At present there is a great diversity of opinion *re* lead *versus* iron for soil pipes. Modern experience teaches us the great advantages of lead over iron, more especially as we can now secure solid drawn lead pipe of any weight and length suitable to our mild climate. It still holds its own as a material for soil and waste pipes in all good work, except in America, where the extreme varying atmospheric changes and its position in buildings render it almost necessary that the soil pipe should be of iron. Still, even in America, lead soil pipe is very extensively used. Lead possesses smoothness of surface (which is essential in soil pipes), maximum resistance to corrosion and incrustation, can be easily bent to suit any position required, perfectly and securely jointed, branches can be easily inserted at any time, and last but not least, when useless as a conductor, will retain its marketable value as old lead. On the other hand, cast-iron pipes of the size required are never very smooth, especially when they exceed 6 feet in length. How often do we find on cutting a cast-iron pipe an absence of that smoothness (so necessary) from the internal surface, although at each end it had a perfectly smooth appearance? Again, the jointing is never so reliable, no matter how well made, and in the event of any deviation from the straight line and branches usually kept in stock, you have to get special connections, &c., made, which entails additional expense and loss of time. No doubt some

will maintain you can procure any description of joint, but experience teaches us differently. Some good authorities, notably Hellyer, prefer that cast-iron pipe when used as a soil pipe should be galvanised, and afterwards coated with Dr. Angus Smith's solution. The idea looks well on paper, but unfortunately in practice we all know the short life of any of the solutions used, and again, in a great many cases it helps to cover defects and imperfections which might exist in the pipe. From practical experience I doubt very much the efficacy of any solution when applied to iron soil pipes. I prefer them without, although I do not for a moment dispute its qualities as a temporary resisting medium to oxidation in iron pipes, when used as a conduit for fresh water. I am at a loss to know why such good authorities prefer that cast-iron pipe should be galvanised when used for soil pipe. I am sure it requires no great reasoning to prove that the use of zinc in any way connected with soil or waste pipes should be studiously avoided and condemned, and no architect or plumber should allow such to be used. Now as to incrustation, I have taken down some cast-iron soil pipes which had been in use for about eight years. When I examined them the amount of deposit on one side of the pipes, especially at the joints, was incredible, but wherever the incrustation was greatest the pipe was perfect, although you could crush the opposite side with your fingers. No doubt the deposit formed a concrete and protected the surface covered at the expense of the other side. I might mention it was a medium description of a cast-iron pipe ventilated but improperly. At a recent Convention of the master plumbers of New York, a section of iron soil pipe taken from a building was exhibited. The exhibit showed in a practical way the ravages made on iron pipe when fixed as a soil pipe. When touched it crumbled into powder, although the drain pipe which was fixed at the same time appeared to be in a fair state of preservation, with the exception of a deposit of rust. If required I could give several instances like the foregoing with date and place.

In speaking thus of iron pipe I do not for a moment condemn it, as I know perfectly well that it will be largely used in our coming work in Melbourne, but I lay the foregoing points before you in order to encourage a discussion, as by such means only can we arrive at a definite issue. Moreover, as a drain pipe I would compel it to be used in all cases when passing through or under a house, for buried in the earth it would be free from the atmospheric influences to which it would be subject when fixed as a soil pipe; but in all cases

care should be taken to avoid the use of galvanised, cast or wrought-iron for soil or waste pipes even when disconnected from the drain. Now as to lead soil pipes, I have often read and heard a great deal about the incrustation on same, but in my experience I have failed to discover anything approaching the incrustation previously described as existing in the iron pipe, even when fixed under much more unfavourable conditions, viz. no ventilation. One proof of this statement. During a building alteration in the Mercy Hospital, Cork, 1881, I had to remove a stack of 4½-inch lead soil pipe which had been in position for over thirty years and was not ventilated. I was astonished at the state of preservation of the lead, the only portion of which that looked suspicious was the soldered seam. I cut the seam out, left the lead to dry, and when I again examined it found no sign of deposit except a small powdered substance. But the lead traps, especially the seal chamber and above it, when touched actually fell asunder, being completely oxidised. Still I do not doubt there have been such cases of incrustation in lead soil pipes met with, but I have never seen them.

One great objection to lead soil pipes when fixed externally is the means usually adopted for fixing it, viz. soldering lead tacks to the back of the pipe or using ordinary holdfasts, both of which should be avoided, as in the usual course of expansion and contraction (no matter how slight) the lead must suffer at the rigid points where either of the above means are used. A better style, and one that would suit all purposes, is a special holdfast, consisting of the ordinary spike welded on to a bell-mouthed ring with a layer of thick felt and lead flange, which would allow the end of the soil pipe to be tacked over and make the ordinary flange (wiped) joint. Also to fix astragals with strong lead lugs, two to each length of pipe, the holes in the lugs to be larger than the spikes or screws used for fastening, to allow for expansion, &c. By adopting this means you at once remove the objection mentioned above and make a perfect job. Another objection to lead is the fear of rats, or as they are called at home, the plumber's friend. I can safely say I have never met with a properly fixed lead soil pipe which was touched by our friends. I have seen soil pipes fixed in very peculiar places, where only a rat could get, and I consider he did a good service in compelling them to remove a hidden death-dealer. No doubt in time we likewise will be asked to fix pipes in unsuitable positions, but I trust we will refuse to do so. No soil or waste pipe should be fixed in out-of-the-way places, but always where it could be easily examined. Another

objection likely to arise in Melbourne is the great heat. Well, to overcome that I would suggest that all exposed pipes should be cased. The pipes being principally at the rear of buildings will not be an eyesore, and the results to property owners will well repay the outlay.

Now as to the use of earthenware pipes, I would strictly limit their use (in houses) to places where no great harm would result from leakage; for no matter how well laid and jointed, there is always a danger of leakage from various causes (subsidence, &c.), also carelessness of workmen. More especially is this the case in Melbourne, where they allow any handy man to lay and connect earthenware pipes, no doubt reasoning that being buried in the ground the water must get away somehow, little caring what damage is done to occupiers or owners of property. I presume you, Mr. Chairman and gentlemen, like myself, have come across earthenware pipe laid with the joints apparently perfect, but on closer inspection have found the bottom without any cement packing, although it was no greater trouble when fixing to make the joints equal all round. Recently I was sent to examine a hotel, erected about seven years, where the cellar was continually filled with water. Several inspections as to the cause had been previously made, but resulted in failure, some suggesting subsoil drainage, &c. The first point that attracted my attention was the level at which the water entered the cellar; after examining the houses on either side, I concluded the leak was from a higher level. I presume the point that deceived so many in previous inspections was a cast-iron drain pipe fixed across the roof of the cellar and which they naturally concluded extended the full distance under the parlour to the sink in the yard. By adopting a test, I soon found the leak was between the sink and the cellar; when I removed the bricks forming the sink the smell was unbearable; several cavities in the cement bottom contained putrid and decomposed matter, which on being disturbed emitted a frightful stench. When tracing I found an earthenware pipe from sink in yard to cast-iron pipe 6 inches from cellar wall, every joint of which was leaking, the end one being separated from the iron pipe, although you could see where it had been inserted in socket of iron pipe. I mention this to prove how unreliable earthenware pipes are when fixed under a building. The brick sink I have mentioned above is very often met with in buildings with a grating over the top. Why anyone could think of fixing them I cannot understand, as they are the greatest propagators of disease in existence and should not be countenanced by architects or builders,

especially as they can easily procure a surface trap which would answer a dual purpose, viz. prevent offensive smells and choking of drain pipes. The bad habit of using earthenware elbows instead of bends is carried out to a great extent in Melbourne, and in a great measure is responsible for so many useless drains.

Of late years the practice is to reduce the bore of the soil pipe to a minimum size compatible with perfect working, but I think the minimum should be $3\frac{1}{2}$ inches for vertical soil pipe (I would fix 4 inches). The more the pipe is reduced the greater the chance of syphonic action, especially when two or more closets are connected to it. And even when the soil pipe is extended full bore to roof (a distance) you increase the friction in the vent (soil pipe) which under certain conditions fails to prevent syphonage. Under these conditions it shows the absolute necessity of an independent ventilating pipe, into which you connect the branch vents near traps. Of course no intelligent plumber would think of connecting the vents on to the crown of traps, although some maintain it is the correct place to vent from. Why? We all know that every time the closet is discharged the lighter substances are bound to strike that particular spot, and eventually close it, thereby making it perfectly useless and dangerous, as the vent being close the trap might lose its seal through syphonage without anyone being aware of the cause. When erecting a soil pipe, for its size we will have to be guided by the number of closets connected on to it; for two or three closets I would recommend that less than 4-inch soil pipe should not be used, the traps being $3\frac{1}{2}$ inches. I would recommend that the soil pipe be extended full bore 6 inches above the highest point of roof, and 6 or 8 feet from the nearest dormer or window, and also that a 2 $\frac{1}{2}$ -inch or 3-inch independent vent pipe be taken from the point between the end of soil pipe and surface inlet of disconnecting trap, but below the grating of same. Then fix 2-inch vents from water-closet branches into independent ventilating pipe and extend same to a level with the soil pipe. By adopting this system you secure the lightest standard of safety whilst also making a perfect and lasting job, which will well repay the additional cost.

When men enter into the kingdom of traps the first feature that strikes us is the great difference of opinion regarding them, each writer maintaining his is the best; in fact, what spoils some fair technical works is the continual repetition of "my trap," "my ventilator," &c., is the best, leading one to believe the work was written to advance the sale of each

writer's wares, instead of advancing the cause of good plumbing, but with all their boasted improvements the ordinary clear-way P.S. and horizontal trap still holds its own. The latest writers in this field are Putnam and Smeaton, the former advocating the "Sanitas" as being the only non-syphoning trap in existence and against venting wastes. Of the "Sanitas" I cannot speak, never having seen one in use; besides, as a commercial article it is useless to plumbers, as no one but the Sanitas Co. will be allowed to fix them. I might say it is for lavatory purposes only. The "Eclipse" trap, to my mind, is a modification of the universally condemned D trap, not even possessing the D's one quality, resistance to syphonage and momentum when unventilated, the outgo being too easy and the seal only one inch. Besides, it exposes too much surface above water level, which is sure to receive the particles of fæces bound to adhere and accumulate, as no water can possibly touch a considerable portion of the top surface. To make matters worse, it is a cast-lead trap, the most treacherous of all kinds, and I consider a cast-lead trap should never be allowed to be fixed. I have known cast-lead traps in appearance as smooth and perfect as glass which had, after twelve months use, to be removed, several defects showing then which could not be detected by the tests to which they were subjected (at least we are led to believe every cast and machine-made trap is tested).

At present we have a lot of mechanical traps on the market—"The Ball," "Flap Valve," &c.—all of which we may set aside, for no matter how well they might act when experimenting, still after a short time in actual work they become perfectly useless and dangerous. I will cite a case. In the board-room of a large warehouse, whenever the directors met they complained of a very bad smell. An examination of the fittings revealed the cause; a badly-made trap connected direct into the sewer from a wash-hand basin, which being very seldom used the trap lost its seal through evaporation. The plumber called in to rectify it suggested the advisability of fixing a ball trap, which he declared would prevent sewer-gas from entering through the trap, even though no water was in the chamber of the trap. About six months after I had to attend for the same complaint. On removing the trap screw I found human hair around the ball, which held some matches as firmly as if tied with fine twine. Some of the hair had gone over the outgo or weir of trap, and the matches held the ball out of position, thus setting up capillary attraction at once. I removed the ball and fixed a properly-made P trap, disconnected

the waste from sewer, allowing for perfect aeration, with the result—no more complaints. This also proves the advantages of disconnection, for even if the trap lost its seal the above alteration removed the danger and decreased any unpleasantness to a minimum.

Of late years a great tendency has been shown towards making traps with a very easy outgo or weir, which is in itself one of the main causes of loss of seal, for when a trap is made with an easy outgo its resistance to momentum is considerably reduced; whereas when properly made with the first sections parallel, and the outgo nearly a right angle, you get what to my mind is the proper standard of a trap—minimum amount of water to allow for thorough cleansing at each discharge and maximum amount of seal to resist syphonage and momentum, of course with proper ventilation. There are other enemies which rob the trap of its seal. First, capillary attraction, caused through hairy or fibrous matter overhanging the weir of trap. Very often it is responsible for unsealing of traps, and the last thought of. As for loss of seal through evaporation, I need scarcely dwell on that, as I am sure no water-closet will be fixed inside the house unless for absolute use, and if they should neglect to use it for ordinary purposes, they can at least allow a discharge of water into it occasionally. The only exceptions are our large city buildings, some of which might be vacant for months. In such cases a means can be arranged to flush the traps at certain intervals.

All soil pipes should discharge into a disconnecting trap fixed at foot of same, the trap to have an iron grating, with large iron bars, to act in a dual capacity, induct for vent and soil pipes; also to receive the wastes from baths or lavatories. At present there seems to be a misconception about disconnection of lavatory and bath wastes from drain. I maintain you should not connect any of these wastes direct into the drain or soil pipe any more than you would the rain-water pipe. No doubt a lot is due to misapplication of technical terms. For instance, in a recent publication, the *Decorator's Gazette*, I noticed a trap styled "The improved Kenon disconnecting trap," when in reality it is an intercepting trap, or, if you like, one form of boundary trap. The intercepting trap is fixed to prevent the gas from sewer entering the house drain and the disconnecting trap to allow the wastes from baths and lavatories to discharge over or near trap, allowing for complete aeration of waste pipes. In a great many cases disconnecting traps have been removed after being in use for a short time, owing to the neglect of plumbers in not fixing a vent or exhaust

pipe between the soil pipe and grating, for when the closet is discharged the column of water in the soil pipe displaces the air in its descent, and if the vent is not fixed as above the foul air is sent through the grating, thereby causing a disagreeable smell, especially if the trap is fixed (as it very often is) under or near a window or door.

Some well-known sanitarians advocate the connecting of drain and soil pipes direct with the sewer, depending entirely on the traps of water-closets and baths, &c., as being sufficient protection against the entry of sewer gas into the house, their contention being that every soil pipe would help to ventilate the sewer and prevent the accumulation of gases therein, entirely overlooking the possibility of the traps becoming unsealed from causes beyond the householder's control. Whilst a strong advocate of direct and continuous ventilation, I would certainly choose a different means from the above to secure it. The ventilation of sewers is not the province of the householder; that portion can be safely left to the boards controlling the sewer to see after. As a proof of the strides the English system has made, the Technical Sanitary Commission of Paris, in 1883, recognising the benefits of disconnection and ventilation, framed their regulations accordingly. Article 5 says all leaders shall be intercepted so as to prevent direct communication with the sewer. Article 7 says every soil pipe and sink waste shall be carried above roof to establish active and permanent ventilation, fully adopting the English system. As for sink wastes, their position will have to be guided entirely by the use made of them, and in the majority of cases it will be necessary to fix a grease interceptor, from which the waste can be conveyed under the grating of disconnecting trap. No doubt some who are against disconnection will argue the dangers likely to arise from such a system, as in the event of a person suffering from infectious disease taking a bath; but with all due respect we might leave that to the doctor to safeguard against. The system is extensively carried out at home, with the most satisfactory results, and I am sure a little consideration will convince the most sceptical of its great advantages. Some writers would use and recommend a non-syphoning trap to all wastes from baths, sinks and lavatories, depending on the flushing for removal of gaseous accumulations and aeration of wastes; but from observation my advice is to avoid them as much as possible and go in for ventilation. You will always find, along with being non-syphoning, they are also receptacles for filth. Of course there are times and places when you will require a special style of trap, and the plumber

will be called on to devise a means to overcome that difficulty. In making any kind of non-syphoning trap it is absolutely necessary that the bottom should taper like an inverted cone, as by this means you increase its cleansing qualities without interfering with the seal. A large brass cleaning screw should be soldered on the bottom of trap.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

"There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

THE "MONOPOL" Fire Extinguisher

FOR MANSIONS, PRIVATE HOUSES, HOTELS, HYDROS, RESTAURANTS, CLUBS, PUBLIC INSTITUTIONS, &c.

MADE IN VARIOUS SIZES.

Light and Portable. The smallest size, which contains Five Gallons, is particularly suitable for extinguishing small outbreaks of Fire. Larger sizes, containing Eight, Ten, and Twelve Gallons, are particularly adapted for Public Institutions, &c. The general appearance of the "MONOPOL" is artistic and strongly built and not likely to get out of order. Architects are invited to specify the "MONOPOL" for the above purposes.

PRICES AND PARTICULARS ON APPLICATION TO

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emperium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208.
Special three motion rod section B, suitable for narrow sashes. It can be used where the sash is insufficient for anything else. This is neat, stylish and reliable.

VARIETIES.

A NEW park has been opened at Newport, Mon., on which the Corporation have spent 20,000*l.* The site, comprising twenty-three acres of land, was the gift of Lord Tredegar.

THE Wolverhampton Town Council propose building a library and reading-room, subject to the approval of the Local Government Board, on a site at Springfields.

A FIRE at Hanley has taken place on the premises of Messrs. Bullock & Bennett, earthenware manufacturers, causing damage to the amount of about 2,000*l.* Two hundred work-people are thrown out of employment.

DURING the excavations at Chichester for the drainage works the workmen have already discovered 225 coins, several vases and jars, three mill-stones, tiles, and an axe, nearly all Roman examples.

A SUM of 760*l.* has been obtained at a bazaar held in Harrogate in aid of the building fund of a volunteer drill hall.

THE Bridgnorth Board of Guardians have received sanction to borrow 1,560*l.* to carry out alterations at the workhouse.

AT Bridge of Weir, Renfrewshire, Sir Wm. Arrol has just laid the memorial-stone of the first of a series of buildings to be used as an hospital for the treatment and cure of consumption. The author of the scheme is Mr. William Quarrier, the founder of the Orphan Homes of Scotland. The total cost is estimated at from 50,000*l.* to 60,000*l.*

THE Scarborough Town Council have decided that proceedings should be taken forthwith for obtaining the consent of the owners and ratepayers of the borough to borrowing 70,000*l.* for the construction of a marine drive and sea wall round the foot of the Castle Hill.

THE Bolton Town Council propose to spend 5,000*l.* on cold stores under the Market Hall and 75,000*l.* on the extension of the sewage system, to meet the requirements of the Mersey and Irwell joint committee.

IT is stated that in the current half-year the Midland Railway Company contemplate expending 650,000*l.* upon new works, the London and North-Western Railway Company 478,000*l.*, and the Great Western Company 250,000*l.*

THE Wallasey Local Board propose to carry out improvements and form a lake in the central park at a cost of 600*l.*

WORKS in the Brede Valley, about seven miles from Hastings, have been in progress for the last two years, and the Corporation of Hastings are now actively proceeding with the scheme for establishing permanent works which will secure a constant supply of deep well water. The water obtained from this district is soft.

AT the meeting of the Paisley Dean of Guild Court plans were passed for the erection of a home for the nurses to be employed in the new infirmary to be built at Paisley.

ELECTRICAL.

THE Middlesbrough Corporation electric-lighting sub-committee propose the laying-down of an electric-light installation at a cost of 25,000*l.*

THE Wolverhampton School Board have accepted the tender of Messrs. T. W. Scott & Co., of Birmingham, at 233*l.*, for installing the electric light at the Walsall Street School.

ELECTRICITY has been adopted for towing the canal boats on the summit level of the Canal de Bourgoyne, which connects the Seine and Soane, crossing in its course the divide between the channel and the Mediterranean.

DURING the year ending May 31, there was a deficiency of 607*l.* on the operations of the electric-light department of the Glasgow Corporation. This result, it is stated, of the first full year's working of the three-wire low tension system compares favourably with the result of last year's operations, when the deficiency was 1,773*l.* 12*s.* 6*d.* The revenue had increased from 7,784*l.* to 18,015*l.* The committee anticipate that the use of electricity will be taken advantage of in larger measure during the current year. The quantity of electricity sold during the year to private consumers was 543,178 Board of Trade units, being an increase over the preceding fifteen months of 107.14 per cent. The gas accounts show a surplus of 4,271*l.* Out of this is defrayed the deficiency in the electric-

lighting accounts, whilst a sum of 3,500*l.* is transferred to fire insurance, &c., fund, leaving 164*l.* to be carried forward.

At the meeting of the Montrose Town Council, a resolution to apply for powers to supply electric light for public and private purposes was defeated. A public meeting is to be called to oppose the lighting of the town by any private company.

THE Glasgow Corporation have arranged for the lighting of the tramway cars by means of electricity. There will be two lamps inside each car and two lamps outside, which will enable all passengers to read newspapers and books.

BUILDING AND BUILDERS.

THE committee appointed to inquire into the causes of the explosion in May at the Waltham Abbey powder factory express their "plain and decided conviction that the position, or perhaps, more strictly, the distribution of the buildings comprising the Quinton Hill factory, and more especially that part of it which concerns the manufacture of nitro-glycerine, is eminently unsatisfactory," and the redistribution of the buildings and the establishing of a duplicate factory on some separate site are recommended.

WORKMEN are clearing the site for the new offices of the Commission of Sewers in Basinghall Street. The buildings will cost 36,000*l.*

M. BOURGEOIS, a contractor at Lourdes, has commenced legal proceedings against M. Zola for allegations in his last romance concerning the building of a church at the "Grotto."

TRADE NOTES.

MESSRS. JONES & ATTWOOD, of Stourbridge, have just opened offices at 110 Cannon Street, London, E.C., where architects and others will be able to obtain full particulars of their well-known heating apparatus.

THE new hospital which is being erected by the Birkenhead Corporation, from the plans and under the superintendence of the borough engineer, Mr. C. Brownridge, is now nearing completion. It is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

"J. R." writes to us:—Sometime ago a circular was sent to my office by a firm offering to supply small lithographic outfits, suitable for use in offices. As I have mislaid their circular, can any of your readers supply me with the address of the firm who sent it out?

THE sites and buildings committee of the Halifax School Board have accepted tenders amounting to over 2,000*l.* for enlarging Siddal School.

THE contracts for the new Manchester and Sheffield Company's line to London have been let as follows:—No. 1 contract, Messrs Logan & Hemmingway; No. 2 contract, Mr. Henry Lovatt; No. 3 contract, Mr. W. H. Topham; No. 4 contract, Mr. Thomas Oliver; Nos. 5 and 6 contracts, Mr. J. T. Firbap; and No. 7 contract, Mr. John Jackson.

WE hear that Messrs. H. Parsons & Harris have recently supplied their patent radiators for warming the cabins of the steam-yacht *Maid of Honour*, for Mr. Francis Barratt, M.A. These radiators are specially suitable for such purposes as this, owing to the remarkably small space they occupy in proportion to their surface.

THE west-end window of the south aisle of Coleshill Church has been filled with a stained-glass memorial window, the subject of which is the Epiphany. The window is designed by Mr. T. W. Camm, of Smethwick, and erected at his studio. The drawing is of an excellent character, and it is thoroughly artistic in colour and treatment generally.

MALVERN COLLEGE.

THE extensive sanitary improvements which have been recently carried out at Malvern College under the direction of Mr. J. E. Willcox, C.E., of Birmingham, are now completed, embracing a thorough reorganisation of the whole of the drainage system and sanitary arrangements, at not only all the College buildings, but at each of the masters' houses in the College grounds, all of which have been put into a perfect sanitary condition. The whole of the fittings are of the most modern type, and the work done throughout of a high order. The undertaking, which involved a very considerable outlay, necessitated the employment for several weeks of some 200 men, including forty plumbers, and was successfully completed without having to close the College. The whole of the plumbing was carried out by Mr. E. France, of Birmingham, and the greater portion of the drainage by Messrs. Wood &

Leach, of Handsworth, whilst the structural alterations, new sanitary blocks, and part of the drainage were executed by Mr. T. Broad and Mr. W. Porter, both of Great Malvern. The sanitary specialties, urinals, latrines and lavatory ranges, &c., were by Messrs. Adams & Co., of London, York, Birmingham and other places, the school lavatories being of white glazed ware, and the urinals consisting of white glazed angular backs, with glazed ware capping and base combined in one piece, and special corrugated drip tiles. The flushing grease traps and drain interceptors were supplied by Messrs. Dent & Hellyer, of London, and the pedestal closets used were Twyford's Deluge M. Messrs. W. J. Williams and T. R. Day acted as clerks of works.

NEW CATALOGUES.

We have received from Messrs. Claughton Brothers, lead founders, of the Sanitary Lead Works, Bramley, near Leeds, a new illustrated price-list issued this month. Since their previous list was issued Messrs. Claughton Brothers found it necessary to remove into larger and more convenient premises, which have been specially designed to meet the increasing demand for their goods. All the articles are of very superior manufacture, none but experienced workmen being employed. A rule of the firm is not only to supply the best quality of goods, but to execute orders as promptly as possible, a practice which cannot be too highly commended. Among the articles illustrated in the list are the following:—Oval stench traps, improved syphon traps, spout funnels, taper pieces or cones, bell traps, junctions, sockets, pipe clips, double-banded pipe clip, soil-pipe terminal, pedestal trap, single tacks, double tacks, lead ears, &c. These goods are beautifully made with the best of lead procurable, and the increasing demand for them should be a guarantee of their excellence. Lastly, Messrs. Claughton Brothers ask their clients to kindly note change of address.

We have received from Messrs. Hart, Son & Peard a new illustrated catalogue (section 7) of their builders' ironmongery. The contents of this edition have been so well arranged that it is even easier than before to consult it for compiling specifications and indents. We may call attention to one feature that will be of great interest to architects, builders and ironmongers, viz. that the great variety of goods include "out-of-the-way" stock. These, when required, are often wanted at short notice, and time is lost unless it is known where they can be had. It is only by glancing over a catalogue like this that persons not

connected with building would get an idea of the multiplicity of objects that have to be illustrated. So simple a part of a house as a door may require much furniture—hinges, door springs, keys, locks and bolts, finger-plates, handles, knockers, letter-boxes, &c., and each one of these articles constitute quite a tribe in their different varieties and designs. With regard to window requirements the same will be found the case in the numberless articles required. Space will not permit us to deal more at length with the contents of the catalogue, but it is evident that a client will have hard work to ask Messrs. Hart, Son & Peard for an article and not be shown it. There are many points of interest that might be mentioned, but our readers can always consult the list for themselves. There are a large quantity of goods concerned with sanitary matters, ventilating and heating, ventilators, gratings, plain and ornamental, rain-water goods, articles also to meet kitchen and scullery requirements.

AN illustrated price-list has been issued by Messrs. Hayward Brothers & Eckstein (section 8), dealing with the Safford hot water and steam radiators, as specified for all first-class buildings; also with the "Daisy" independent boilers. Messrs. Hayward Brothers & Eckstein inform us that they do not erect apparatus, but afford every facility within their power to aid the hot-water fitter in securing and working an efficient apparatus; and that, notwithstanding the variety of sizes they offer of the Safford radiators and the "Daisy" independent hot-water boilers, they keep a complete stock so as to secure reasonable prompt delivery. They add that heating is now so well understood as to require but little consultation on the part of their friends with reference to the ordering of plants, but having studied this question in Canada, where the question of heating is of vital importance, they have now entered upon the manufacture of the Safford screwed nipple radiators and the "Daisy" independent hot-water boilers, which combine every possible advantage with durability, having a reputation already established. They now offer these radiators and boilers, which for simplicity of form, extent and quality of surface, together with cheapness and economy, give the best results ever obtained, and challenge examination and comment from hot-water engineers and others. The rapid advance in heating by hot-water circulation, they say, is worthy of attention, and it has been demonstrated by experience that this system is superior to all others on account of its many advantages and economy in fuel. The list will be valued by many owing to the practical directions and information given in the pages.

THE HALIFAX MARKETS.

At the last meeting of the Halifax Town Council, there was reference to a statement about the contracts for the new arcade which was submitted by the architects, Messrs. Leeming & Leeming, showing a total of 13,496*l.* 3*s.* 10*d.*, and the extras added, the amount was brought up to 13,987*l.* 0*s.* 10*d.*

Mr. J. T. Spencer asked for some explanation relative to the excess of the cost of the markets over the original estimate.

Alderman Smith (chairman of the committee) remarked that Mr. Spencer was a member of the committee, and he had had the opportunity of acquainting himself with every item of the expenditure.

Mr. Spencer said the advance over the original estimate was equal to about 70 per cent.

Alderman Smith said he could give the details if the councillor were prepared to listen to him for a few hours.

The Mayor remarked that Councillor Spencer must either accept the statement as given in the report, or move an amendment.

Mr. Spencer moved that the statement be referred back, in order that some explanation might be given accounting for the enormous difference of almost 70 per cent., as between the actual cost and the architects' estimate.

Alderman Whitaker seconded. He said there were several discrepancies between the architects' figures and those given by the borough accountant. Misleading statements should not be made.

The Mayor observed that he did not see what would be gained by the adoption of the amendment, seeing that Councillor Spencer was on the committee, but as suggestions had been made which would almost make it appear that there was something going on there ought not to be, it would be best, perhaps, to refer back the statement.

Mr. H. E. Greenwood remarked that the contractors' tenders were sanctioned by the council, and it would amount to a censure upon the council to pass the amendment.

Alderman Whitaker : Nothing of the kind.

Mr. Greenwood : It is a gross misrepresentation.

The Mayor remarked that it was not the first time statements of a similar character had been made. It was necessary that the council might see that all was right and square that the statement should be referred back.

Alderman Whitaker considered it very unfair for the Mayor to make such remarks and not to allow him (Alderman Whitaker) to have a word.

The council resolved to send the statement back to the committee.

THE PANAMA CANAL.

WHILE returning recently from an engineering engagement in Ecuador, I was compelled to stop over in Panama eight or ten days to await steamer connection in order to reach the United States. Naturally, out of professional interest, I utilised this opportunity for an examination of the Panama canal, as it appears to-day, the result of which is this article. It may be remarked, however, that the figures used here are taken from the calculations of M. de Lesseps's engineers, and they are given for what they may be worth, as the time at my disposal did not permit any separate reliable calculations to be made.

As the canal has been surveyed and laid out between Colon, on the Atlantic, and Panama, on the Pacific side, it will have a total length of 46.7 miles. Owing to the peculiar formation of Panama Bay, the Pacific end is really the eastern terminus of the canal. The canal runs through the valley of the Rio Chagres and almost parallel to the Panama railway until within a few miles of Panama. Its distance from the railway varies

from a few hundred feet to about half a mile. The proposed general width of the canal is 72 feet at the bottom and 100 feet at the water's level, with the exception of the section between San Pablo and Pedro Miguel, where the respective widths, as proposed, would be 78 feet bottom and 102 feet at the level of the water. The navigable depth is to be from 28 to 29 feet, and all curves of the canal to be constructed with a radius of not less than 8,000 feet. At the mouth of the canal at La Boca, about three miles south-west of Panama, it is proposed to build a basin or kind of harbour, about 5,000 feet long by about 400 feet wide, for vessels to await transport, and at Tavernilla, about midway between the Atlantic and Pacific, another to allow ships to pass each other.

The elevations along the canal route are about as follows:—From Colon to Frijole, a distance of eighteen to twenty miles, the ground rises almost uniformly to 25 to 30 feet, with the exception of a short distance at Bohio Soldado, where the elevation reaches 160 to 170 feet above sea level. Between Frijole and Matachin, about eleven miles distant, the elevations vary from 50 to 115 feet. At Matachin is another short loma (hill) of about 155 to 165 feet elevation. From Matachin to Culebra, a distance of about six miles, the elevations run from 90 to 260 feet until they reach at Culebra the highest point on the whole route. Here the cerro is about 323 feet above sea level for a distance of nearly 1,000 feet. From Culebra the ground falls again uniformly to the Pacific, with an elevation of about 15 feet at the junction with the Rio Grande.

According to surveys and observations made by the engineers of the Panama railway during its construction, the mean level of the Pacific is from '14 to '75 of a foot over that of the Atlantic. The highest tide at Panama is 21'30 feet, and the lowest 7'94; the highest spring tide in the Pacific over the highest spring tide of the Atlantic is 10'12 feet, the mean high tide of the Pacific over that of the Atlantic is 6'49 feet. These conditions would, if the canal is constructed as a tide-water connection, enable vessels to make the passage on one tide of six hours' duration.

The French engineers have calculated the total canal excavation necessary at something like 157,200,000 cubic yards, of which about 24,000,000 cubic yards are contained in the Culebra cut. This amount, I understand, includes also extra work outside the canal proper—for instance, laterals for draining the Rio Chagres, &c. Of this total excavation I judged that about from three-eighths to one-half—or about 70,000,000 cubic

yards—has been done. Of the total length of the canal, about one-half, including about fifteen miles on the Atlantic side, has been finished, or very nearly so, and there is water in this portion on both sides, its depth varying from 18 to 23 feet. The finished part is in comparatively good condition. Besides the work already done, the canal company has on hand, distributed at both terminals and at convenient points along the canal route, an immense stock of machinery, tools, dredges, barges, steamers, tugboats and materials for continued construction. At Panama, La Boca and Colon, as well as along the canal, are numerous buildings, large and small, for offices, workshops, storehouses and warehouses, and for lodging and boarding the men who were employed on the work. The finished work, as well as all the machinery, tools, materials, buildings, &c., are well taken care of and looked after. The canal company employs 100 uniformed policemen, besides numerous watchmen, machinists and others, whose sole duty consists in watching the canal and looking after needed repairs of plant and care of materials. In fact, the work and the whole plant is in such a condition, so far as I could ascertain, that renewed construction could be taken up and carried to a finish at any time it is desired to do so, after the company's finances will permit. In this connection it may be mentioned that the canal company has built, and still partly maintains, a hospital in Panama, which in magnitude, comfort, equipments and general appointments excels some of our best American hospitals, and in fact could give them good points in hospital management. This hospital, which is in charge of the French Order of Sisters of Mercy, is situated about $1\frac{1}{2}$ miles north of Panama, on beautifully laid-out grounds, at an elevation of 300 to 400 feet above sea level, giving a magnificent view of the suburb bay at Panama and the surrounding country. It consists of sixty or seventy large, roomy and airy buildings, and contains inside the grounds its own waterworks, drainage system, slaughter-houses, dairy, drug-stores, &c., so that in case of any epidemic the hospital could be shut entirely out from communication with the low-lying city of Panama. Patients unable to pay are treated free in the same manner as those who are able to pay for their accommodation. At Colon there is a smaller hospital under similar management.

Now as to the feasibility of finishing the canal, and the difficulties to be overcome. The latter naturally resolve themselves into two classes, relating to the engineering and the financial features. As far as I could see, the engineering plans seem feasible and the obstacles such as might readily be sur-

mounted. The chief difficulties encountered are:—(1) The prevention of the Rio Chagres from overflowing its banks during high waters and flooding the canal; and (2) the Gulebra cut.

The Rio Chagres is a mountain stream, having its headwaters in the Andes, which the canal crosses at Culebra. Like all mountain streams, it is treacherous. In the dry season, and under ordinary circumstances, it discharges about 500 cubic feet of water per second. In the rainy part of the year, which lasts from six to eight months, during which time daily heavy rainstorms occur, the discharge of water per second rises to 20,000 cubic feet or more; it has even been known to reach the enormous quantity of 65,000 cubic feet per second, with a rise of the water to 45 feet above its normal level. The watershed drained by the Chagres, as far as it can influence the canal, is not very large or of much importance. The extreme high waters are caused by the heavy tropical rains. In order to protect the canal from such an enormous inflow of water from the river, which of course would soon destroy it and its usefulness, two plans have been proposed by the French engineers. The first one is to dam the Chagres at such a point as will retain the water, during rainstorms, long enough to permit the discharge to be controlled to its normal flow. The other is to change and enlarge the channels of the river, so that the water during the high floods will be discharged at a distance far enough away from the canal to secure its safety. Neither of these plans, so far as I understand, has been based upon accurate surveys or calculations. Upon a casual examination, the first one—damming the Chagres—seems to me the most feasible, and probably the least costly.

After passing Matachin the river turns in an easterly direction, leaving the canal, and at Gamboa passes between two mountains—Cerro Obispo and Cerro Santa Cruz. Here it is proposed to construct the dam, which would probably be about 5,000 feet long and 150 to 160 feet high. An outlet of the water from the dam by a tunnel through Cerro Azul, to the left of Cerro Santa Cruz, is also proposed. The storage capacity of the reservoir behind the dam is claimed by M. de Lesseps's engineers to be somewhat like 105,900,000,000 cubic feet. The cost of the dam is estimated at about 1,600,000 dols. To build such a dam, with its tunnel outlet and laterals, probably may at first seem an enormous undertaking. Its construction in point of engineering would, I fully believe, offer no insurmountable difficulties.

The Culebra cut is situated about nine miles from Panama.

Its total length is about two miles, and the highest elevation, as already noted, is 323 feet above the sea level. It has lately been proposed to tunnel through the highest portion. A French engineer has proposed recently to construct a lock on either side of the cut, so that it would only have to be excavated to a depth of 75 to 80 feet. This latter plan would undoubtedly save much time and labour, and probably also decrease the cost. But it would deprive the canal of one of the principal points in favour of its construction—that of making it a tide-water connection. The cut would require about 24,000,000 cubic yards of excavation, of which the greater part is rock. Nearly all the excavated stuff could be utilised in the construction of the dam across the Chagres. I do not see any great difficulty in taking out the whole cut as originally proposed, aside from the time and labour it requires, and even that would be materially less than anticipated by the French engineers if the work were conducted properly and honestly. Some work has already been done in the cut, but none at the dam besides some preliminary examinations.

It has also been argued that the question of labour as well as the unhealthful conditions on the isthmus would prove a serious difficulty to overcome in finishing the canal. Undoubtedly the French, while they pursued the work, had much trouble in regard to labourers. The chief cause of this was that the French contractors picked up many of their labourers from the slums of all countries. These men were unaccustomed to this kind of work and also to the climate. In many cases they did not desire work, but came out to the isthmus simply for the sake of adventure. Their past lives and environment made them an easy prey to disease, and they consequently increased the death-rate, always heavy among the unacclimated in a tropical climate. If the work were to be taken up to-day, I believe that any number of native labourers could easily be had, if not from the isthmus itself, from the surrounding South and Central American republics, and from Jamaica, &c. These labourers, mostly negroes, are strong, healthy and good-natured men, accustomed to work in the tropics. Their chief fault is laziness, but, properly managed, they would soon get over that, and prove to be very efficient and cheap workmen. There has been no yellow fever on the isthmus for several years, but only sporadic cases of intermittent fever. As the work on the sections of the canal through the swamps and marshes has been finished, it is not supposed by the natives that any great amount of illness would be caused by the renewal of work on higher ground.

As to the financial question, I must, as an engineer, hold aloof from saying anything about the probable cost of finishing the canal. It would simply be guesswork with the time at my disposal, and management by guesswork has already proved a costly feature in the history of the Panama canal. It should be remembered, however, in this connection that although vast sums of money have been expended, and much of it uselessly, about half of the canal is finished, or very nearly so, and a large, valuable and well-kept construction-plant, machinery, materials and buildings, &c., are on the place ready for work. Before the work is taken up anew it is an essential necessity that the present company should be thoroughly reorganised under good and honest management. It is also absolutely necessary to have an accurate examination, survey and estimate made by competent engineers of the work already done and what remains to be done, as well as of the stock, machinery and materials on hand, upon which to base future financial calculations.

The watchword of the new management should be efficiency and honesty. The French management was rather "a white elephant" upon the company's hands, more elaborate than useful. All the officers necessary on the isthmus would be a competent, honest chief engineer, with an equally competent engineering staff, and an efficient, honest general business manager.

THE BETTERMENT QUESTION.

MEETINGS of the Association of Municipal Corporations were held in London while the subject of betterment was under the consideration of a select committee of the House of Lords. Two reports were prepared, one by the Mayor of Crewe as representing the opinion of the majority, and a second by the Deputy Town Clerk of Liverpool containing the views of the minority.

The committee recommended the Association to receive both reports of the committee as ably representing the arguments for and against betterment, and to adopt that of the majority as indicating the possibility of practically and beneficially applying the principle on just and equitable lines. The committee, however, admitted that there is still much to be learned from actual experience, and they therefore make their recommendation tentatively and with the object of the municipalities gradually building up an approximately perfect system

(as has been the case with so much legislation affecting the various localities of the country), from the comparative views, work and experience of different districts. The question of the taxing of ground values was reserved for further consideration.

The following is the report prepared by the Mayor of Crewe :—

Where improvements are effected at the public cost which substantially and permanently increase in value any particular property, such increased value, or a portion of it, should be secured to the public authority by whose outlay the increased value is created. This is in broad and general terms a definition of the principle of betterment. To take an example, which has been mentioned by a member of this committee, the town council of a borough in the South of England have recently at a considerable cost purchased and demolished one side of each of two narrow streets, and have converted them into broad thoroughfares. In addition to the general benefit in the way of traffic facilities which this improvement has conferred on all the members of the community, the individual owners of most, if not all, of the property fronting to the other sides of these widened streets have received a special benefit, inasmuch as their property has been greatly enhanced in value. Those who believe in the principle of betterment say, in a case of this kind, that in addition to the general contribution by way of rate levied on all the inhabitants, the individual owners so benefited ought, in consideration of their special benefit, to make a special contribution to the funds of the public authority, and ought not to appropriate the whole of the enhanced value. To this general proposition almost everyone assents, but as to the proper machinery for carrying the principle of betterment into effect there is a very wide diversity of opinion. It is as to this practical application of the principle of betterment that we have to report.

Several schemes for carrying out this principle have been suggested by members of this committee, but as the mere outlines have only been given, it is thought that, in the absence of the detail so absolutely essential in a case of this kind, no useful purpose would be served by reporting on them. One at least of such schemes will, we understand, be brought before the Council of the Association in a separate report.

However, in the Tower Bridge Southern Approach Bill, and in the Manchester Corporation Bill now before Parliament, this abstract principle of betterment has been reduced to concrete form, and we accordingly propose to deal with the betterment

provisions of these Bills (which are practically identical), and with the objections which have been raised to them.

We may say, by way of preface, that the London County Council have in previous years introduced Bills to Parliament in which betterment clauses have been inserted. These clauses have been extensively criticised in the Press, and have gone through the ordeal of a powerful opposition before committees of the House of Commons. The betterment clauses in the present Bill have been carefully and deliberately framed in view of the experience so gained, so that, whatever their demerits, they are no crude, hastily considered, or badly drafted proposals. The two Bills referred to have both passed the second reading of the House of Commons without a division, and, with certain amendments not affecting the principle of betterment, have now passed the committee stage. These betterment clauses have the support of a large majority of the London County Council, and practically the unanimous support of the Manchester Corporation. In the House of Commons they have the support of men of all parties, including Sir William Harcourt, Mr. Balfour and Mr. Chamberlain. We mention these facts, not as any reason why this Association should support these proposals, but only to show that they are approved by eminent and intelligent men who have studied the question; that they are not the absurd or revolutionary proposals which some critics would have us believe, and that they should not be dismissed or disapproved by this Association except upon very careful and impartial consideration.

I.—As to the Betterment Provisions in the Bills above referred to.

In the plans accompanying the Bills, an area is defined which may be called "An Area of Inquiry as to Betterment." Most of the adverse criticism of the Bills arises from a misunderstanding as to the meaning and object of this area, and it is very desirable, therefore, that this point should be properly understood. It is not an area within which every property is to be specially charged, but an area within which there shall be an inquiry as to whether or not any particular property has been benefited by the improvement. The limits of this area will have to be stated in their plans by the Council applying for the Bill, and, as part of the Bill, must of course be approved by Parliament. The necessity for this defined area arises solely from the Standing Orders of the Houses of Parliament relating to private Bill legislation, which require that a separate notice should be given to every individual interest affected by a

private Bill, so as to afford the person affected the opportunity of appearing and being heard in opposition. The boundary of this area will vary in each particular case according to circumstances, but it should no doubt be wide enough to include every property which may be specially benefited by the improvement. It is obvious that wherever the limits are placed there are certain to be properties within it which are not benefited; but in view of the fact that it is simply an area of inquiry, and not an area of taxation, this is unimportant. Within the area so defined as aforesaid, any property not taken by the Council is liable to be charged in respect of any substantial and permanent increase in value which it is clearly shown has been or may be derived from the improvement.

The course of procedure to fix the charge (if any) to be paid by the owner is as follows:—Before the improvement is commenced some independent person is appointed by the Local Government Board to make a valuation of such property in the area as shall be specified by the Council, such valuation to be independent of the improvement, and as if it had not been contemplated. The object of this valuation is of course to obtain and record evidence of the value of the property before the improvement. After the improvement is carried out (but not later than seven years from the passing of the Act) the Council is to make an assessment on such of the properties comprised in the valuation as they consider to have been enhanced in value. This assessment is to contain a statement of the amount of such enhanced value, and the charge to be placed on the property is 3 per cent. upon one-half of this amount. If, for example, the estimated enhanced value is 1,000*l.*, the betterment charge would be 3 per cent. on 500*l.*, i.e. 15*l.* per annum. Under subsequent provisions this betterment charge may be redeemed at any time, so that if the owner prefers to pay his 500*l.* down he can do so. If he prefers to postpone payment of the amount due, he is charged until payment the moderate interest of 3 per cent. on the capital sum due from him. The assessment abovementioned is to be advertised in the newspapers, and served on the parties interested. If any owner objects to the assessment in his particular case, he is to give notice to the Council of his objection. The Council may accept the objection, and alter the assessment in his particular case, but failing an agreement, the Council applies to the Local Government Board to appoint an arbitrator to decide the dispute. The decision of this arbitrator is final, but he may state a special case to the high court on any question of law. The arbitrator is to consider the different interests in the property, and is to

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

apportion the charge between the freeholder and the owners of any other interests in the property as he may think just, having regard to existing contracts. The charge is to be collected from the occupier of the property, but if he is not the proper party to pay it, he may deduct it from the rent payable by him to his landlord in the same way that property tax is deducted.

There are a number of subsidiary provisions, but we believe the above gives a fairly accurate outline of the betterment clauses as they at present stand. To the municipality and to the ratepayers generally the advantages of these clauses are obvious. They intercept, on its way to the owner of property benefited by the improvement, one-half of the value which he derives from it. To this owner there is no injustice, as he still obtains as a gift from the public, and as an addition to the existing value of his property, one-half of the enhanced value, while to the general ratepayer there is the advantage that the cost of the improvement is materially lightened. Briefly, these betterment clauses are a method to take a portion of the profit of the few who are specially benefited to lessen the burden of the many who receive no special benefit. Naturally enough, the few prefer the present system, which allows them to take the whole profit of the improvement, and, represented by able counsel, they have strenuously opposed these Bills in committee.

It may be taken for granted that no Bill was ever introduced into Parliament against the passing of which some reason could not be adduced. These betterment provisions are no exception to the rule; but, while we admit the ability and plausibility of the opposing arguments, yet we venture to think that the weight of argument is strongly in favour of the provisions.

II.—As to the Objections to the Betterment Proposals.

1. It has been urged that under the existing law the owner of an improved property pays a betterment charge. It is said that if by reason of a public improvement a given property rises in value from, say 100*l.* to 200*l.* a year, the rating assessment of the owner will rise also, and that the increased rate thus paid in respect of the property is a sufficient contribution to the cost of the improvement. With this proposition we do not agree, and we think that a slight consideration will show that it is fallacious. All property is liable to be rated in any event, and all rates are simply a payment by the individual for definite services (such as sewerage, lighting, watching, paving, &c.), rendered to him in common with all other members of the community. In other words, payment of a general rate is

a payment for general services rendered, and in no sense can it be considered as a payment for special benefits such as are contemplated in the betterment proposals. To take an example, we cannot agree that when by the expenditure of public money a property is raised in value from 100*l.* to 200*l.* a year, that the extra rate paid by the tenant of the property is a sufficient contribution from the owner in respect of the 100*l.* a year which the improvement has placed in his pocket. Argument may obscure, but it cannot alter, the fact that such owner gains a 100*l.* a year, and the betterment proposal is that one-half of the gain should go towards the opening of a new street; a plot of land which had formerly an agricultural value, say 100*l.*, becomes available for building purposes, and is sold for 500*l.* to a purchaser who erects a house on it. The vendor has put into his pocket 400*l.* created by public outlay, and we think it clear that the rate which the purchaser pays on the house which he erects on the land is in no way a betterment contribution by the benefited vendor. We consider that the payment of increased rates by the tenant can in no way be considered a betterment contribution by the owner, and, therefore, that in asking for such a contribution from the owner he is not being "taxed twice over" as alleged.

2. Another prominent objection is stated by the opponents of betterment somewhat as follows:—"It is true that a public improvement benefits some property and increases its value, but it is also true that, by reason of the diversion of traffic into the improved street or like causes, other property is damaged and decreased in value. If, therefore, you are going to make people pay for 'betterment,' it is a necessary corollary to the proposition that you should pay others for 'worsement.' Your Bill contains no provision for payment for worsement, and therefore we object to it." At first sight this appears to be a very good objection, but it vanishes on a closer and more careful inspection. In the first place it should be clearly understood that by Sect. 68 of the Land Clauses Consolidation Act, any person affected by the execution of the works is entitled to compensation for any damage he may sustain thereby. Thus, for example, if the level of a street were raised, and a property fronting to it is thereby damaged, it is clear that, under the present law, the owner could obtain compensation. The contention of the objectors, if carried to its logical conclusion, is that compensation should be given, not merely to owners who have had the property damaged by the carrying out of the works, but to owners in adjoining streets, who allege that by the diversion of traffic to the new street their

property has been depreciated. Let it be granted that it occasionally happens that property in a street adjoining an improvement is depreciated by the diversion of traffic. This evil, if it be one, is an evil which exists under the present system. Does any one seriously propose at the present time that the owner of property depreciated by alteration of traffic should be compensated? We believe that no one acquainted with municipal work would ever make such an impracticable proposal. As we have said, this grievance, if it be one, exists at the present time, and from the fact that no legislation has ever been proposed to remedy what we are told is a crying evil, we conclude that this class of depreciated property owners is by no means so numerous, nor are their grievances so great as the opponents of the Bills would have us believe. It should also be borne in mind that at the present time such an owner not only has his property depreciated, but in his rate he has to contribute to the full cost of the public improvement which injuriously affects him. By the application of the betterment principle, at any rate a portion of this burden will be taken from him and placed on the shoulders of his more fortunate neighbour. Whatever therefore the betterment principle may do, it will at any rate improve the present value of the depreciated property owner. Moreover, even granting that this depreciated property owner has a grievance, this is no reason whatever why a totally distinct grievance, viz. that improved property owners do not contribute to the cost of the improvement which enriches them, should not be at once remedied. We do not think, however, that any depreciated property owner has a grievance which is not met by the existing law. If his property is injuriously affected by the works he can get compensation, and to compensate for mere change of traffic is impracticable, as indeed most of those who bring forward the objection admit. If it were a reasonable, necessary and practical proposal, it ought to have been introduced into every Improvement Act which has ever been passed. We believe that the proposal is as unnecessary as it is impracticable, and we fail to see in it any reason for not attacking a grievance vastly greater, and which is certainly capable of remedy.

3. A number of cases have been stated to us where the effect of a public improvement has not been to better the adjoining property. That cases of this kind happen is of course known to us all, but we fail to see that this affects the question in any way. If it were proposed to charge all the property in a given area, this objection would certainly have weight, but as it is only proposed to charge those properties in

the area which are "substantially and permanently increased in value" it falls to the ground.

4. It is said that under these clauses it is proposed to put a permanent charge on the land for what may be a temporary and evanescent improvement. If it be granted that it is just that an owner whose property is enhanced in value 1,000% by a public improvement should pay 500% towards the cost of it, it is surely no hardship if for his own convenience the payment is postponed, and he is charged 3 per cent. interest in the meantime.

5. It is said that the cost of assessing the charge will be out of all proportion to the benefits to be received from it, and figures are given showing the estimated costs of an arbitration over each assessment. All this is based on the assumption of the very improbable fact that all the assessments of the council will be appealed against. We say, however, that appeals against the ordinary rating assessments form a very small percentage of the whole, and even in compulsory purchases under the Land Clauses Act it is not one case in twenty that goes to arbitration. We have some ground, therefore, for thinking that appeals to the arbitrator will not be a common occurrence, and that the assessment to the authority will not be excessive.

6. It is said that the betterment charge will be uncertain and arbitrary, and at the best will be a mere guess on the part of the valuer. We do not think it is impracticable or even difficult for a competent valuer to fix the value (*i.e.* what it is likely to fetch in the market) of any given property. This is done by valuers every day with every kind of property, and for various purposes. The difference between the value before the improvement and the value after is to form the basis of the betterment charge, and we do not think the valuer will have any great difficulty in arriving at it. The mental process which every valuer goes through may be called "guessing," but it does not alter the fact that the guesses of a valuer are reasonably and approximately correct, and that ordinary rating assessments are at present fixed by exactly the same method.

7. It is urged that municipal authorities have an easy method of securing the betterment by what is known as "recoupment," *i.e.* by purchasing more land than they actually require, and then by its sale after the improvement is completed recouping themselves for its cost. This scheme has been tried, and has, generally speaking, failed, the reason being that in buying the extra property the municipality has to pay not only for land and property which they can sell again, but

also for compensation for disturbed trades and businesses, for which there is no return.

8. It is said that the betterment principle places an undue opportunity for jobbery in the way of the members of the Council, and that a member may bribe them to under-assess his particular property. The possibility of jobbery is bound to exist in many departments of municipal work, but we think we have reason to hope that the actual crime is of rare occurrence. It is unlikely that any owner could bribe or influence the majority of the members of a Council to under-assess him, and as the assessment is publicly advertised, any unfair dealings would immediately come before the public eye. The ordinary assessment for rating purposes is financially much more important than betterment assessment will be, and as one seldom, if ever, hears of jobbery in the one, we have reasonable hope for its absence in the other.

9. It is objected that the principle of betterment is a new fangled one. Even if this were true, it is clearly no good objection in itself. If the principle is just and equitable, if its application is expedient and practicable, it should become law whether there is any precedent for it or not. It is, however, by no means a new principle. In the Statute 13 & 14 Charles II. cap. 2 (which authorised certain street improvements in the City of London), after reciting that "the houses that shall remain standing on the other side of the said street or streets, or behind the said houses that shall be so pulled down as aforesaid, will receive much advantage in the value of their rents by the liberty of air and free recourse for trade and other conveniences," it is enacted that "in case the owners and occupiers do not agree and compound with the commissioners for the same, that a jury shall be empanelled to judge and assess upon the owners and occupiers of such houses such competent sum or sums of money or annual rent in consideration of such improvement as in reason and conscience they shall judge and think fit." The principle of betterment was thus recognised as a just one over two hundred years ago, and has in various forms been embodied in subsequent legislation. One of the latest examples is to be found in the Housing of the Working Classes Act, 1890 (53 & 54 Vict. cap. 70, sect. 38), which provides that where any building stops ventilation to other buildings so as to make the latter injurious to health, such obstructive building may be acquired and demolished, and where such demolition adds to the value of the adjoining property, a special charge may be laid on such property by way of improvement rate. See also section 41 (2 b) of the

same Act, which provides that in settling the amount of compensation to be paid for property taken for the purposes of the Act, the arbitrator is to have regard to any increased value given to other property of the same owners by the alteration. While we do not consider the question of precedent an important one, we are nevertheless satisfied that the principle of betterment has been frequently embodied in enactments of the legislature.

There are numerous other minor objections and difficulties which we have considered, but which would take too much space to deal with in detail.

It would of course be impossible to devise any plan of dealing with this betterment principle which would not be open to some real objection, and it is certainly hopeless to expect that any scheme could be propounded which would not be capable of being represented by clever opponents as fraught with numerous more or less imaginary perils. We do not say that the betterment proposals in the Bills now before Parliament are perfect, or that their working will be attended with no difficulty. We do say, however, that they are fair and reasonable proposals for carrying into practical application that principle of betterment in which most of us believe. In the smaller towns especially, really necessary public improvements are often barred by the cost, and as the adoption of the betterment principle seems to us the means of lightening the general burden without doing injustice to anyone, we believe that it will be an important aid to municipal progress and development. The London and Manchester proposals are the only concrete form in which the betterment principle has been expressed, and we consider that it will be a matter for regret if they do not pass into law. It has been the practice of this Association to encourage reasonable experiments in municipal government, and even to take no higher ground than this, we think the influence of the Association should be exerted to secure the passing of these Bills. It is through knowledge gained by experiment that most of our municipal progress has been made in the past, and it must be so in the future. These are not public Bills, which, if passed, will bind all municipalities; they are private Bills affecting only particular corporations, whose example in their betterment proposals we may either follow or avoid according as the result of their experiment indicates. Should these clauses work well, as we believe they will, they may (grafted, perhaps, on to powers for the more easy compulsory acquisition of land for municipal purposes) be the foundation of some future Act of

Parliament applicable to the country as a whole. On their own merits, however, and as a practical application of the principle of betterment, we commend them to the general approval of the council of this Association.

(To be concluded.)

THE ANCIENT IRISH CHARCOAL IRON INDUSTRIES.

IN prehistoric times Ireland was, the *Irish Times* says, noted for its superior iron. "The annals" suggest that one of its exports in Phœnician time was iron to be used in the manufacture of the famous Damascus steel. This, however, cannot be stated positively; we must, therefore, come for undoubted record to more recent time. Irish iron was evidently prized in Strongbow's time, as two of his knights, De Raymund and De Silbery, started as rival ironmasters in Cathan, now a portion of the county Wicklow, the remains of their old castles being found on the old horse trail between Arklow and Shillelagh, while the remains of a very peculiar iron works, said to have belonged to one of these knights, was cut through while constructing the new "Van Road" from Rathdrum to Aughrim. The manipulation of the iron ore must have been quite distinct from any modern system, as associated with this old mine are numerous bulton or rock basins in blocks of granite, these basins being from 1 to 2 feet in diameter and from 1 to 3 feet deep, evidently being mortars in which the ore was pounded up. It has been suggested that these primitive iron smelters pounded up the ore with charcoal and smelted it in crucibles. This is extremely probable, as iron is smelted somewhat similarly in parts of Africa, while in places in the county Donegal are found saucer-like masses of slag—ejecta from crucibles.

To come, however, nearer to the present time—Chichester, in his report, 1609, states he found in Ulster native smiths at work making steel out of the native iron, "which they wrought much more easily than it could be made in England." After Chichester's report there was an inundation of English adventurers, as recorded in 1646 by Gerard Boute.

The Boyles (Lord Cork) started mines, furnaces and mills in divers places in Munster; the Whites in divers places, co. Cork; the Wandesford in Carlow and Kilkenny; Sir Charles Coot (Cootes of Mountrath), who seems to have been the largest manufacturer in the Queen's County, Leitrim and Roscommon; Lord Londonderry, in the Queen's County; Lord Ely and Mrs. Pigott in the King's County; Dunbar

and Blennerhasset in Fermanagh; a London company on the Lower Shannon (counties of Limerick and Clare); Petty (ancestor of Lord Lansdowne), Kerry; Lord Stafford, Wicklow and Carlow; Sir Walter Raleigh, Waterford; and in more recent times Rennie in Londonderry and Tyrone; Bacon and Chamney, counties of Wicklow and Wexford; the Beeches, of Marble Hill, Woodford, Galway; Bradys, Tomgrany, co. Clare; Gildeas, Port Royal, co. Mayo, and others in Tipperary and elsewhere, where iron mines occurred. The names, however, mentioned, are sufficient to show what an important industry this iron trade once was; but in connection with this statement, it should be remembered that this iron was "charcoal iron," similar to the present far-famed Swedish iron. Gerard Boute, writing in 1646, pointed out that the Irish woods were nearly exhausted, most of them having been burned down by the English after the rising in 1640, and that the ironmasters must turn their attention to manufacturing charcoal from peat. This they did not do, and as the woods disappeared so did the furnaces, till the last was put out at Shillelagh about 100 years ago.

In Sweden, whose iron replaced the Irish supply, the woods are now becoming exhausted, but these, more foreseeing than the old Irish iron manufacturers, are taking time by the forelock and are substituting peat for wood charcoal. The question therefore is, if they can use peat charcoal why cannot the same thing be done in Ireland, where there are real peat accumulations and unlimited iron veins?

This is a subject that ought to be of special interest to all the descendants of the old ironmasters or others that have succeeded to their former properties. Of course, in some places the bogs have now disappeared in the vicinity of the iron veins and deposits. This, however, is a secondary consideration, because if iron is required at a furnace it must be procured—thus Dutton, in his history of Galway, states the iron came up the Shannon to the furnaces on Lough Derg. Bacon, of Shillelagh, made his money that way, importing English iron. His son-in-law, Chamney, developed the trade by opening mines in the vicinity.

Particulars as to the names of these different ironmasters and the localities where the iron was raised and smelted, also the sites of the iron mills, are given in the "Economic Geology of Ireland," vol. viii., new series, Journal Royal Geol. Soc., Ire., in the section on metal mining. To these lists, &c., those interested in the subject may be referred.

These old ironworks at the present time have special

interest, as a company is now formed to attempt to reintroduce the manufacture of charcoal iron in the province of Connaught, at Sir Charles Coote's old mines of Creevealea, co. Leitrim, where some of the richest ores are located.

Up to the present time the manufacture of charcoal iron seemed to be an impossibility on account of the prohibitive price of peat charcoal. This impediment, however, seems now to be surmounted by the "Rose retorts," as an excellent charcoal can be manufactured at a small price, while the by-products (sulphate of ammonia, &c.) can also be saved, thus materially reducing the cost price of the charcoal.

MERCERS' SCHOOLS, BARNARD'S INN, HOLBORN.

The Mercers' Company for some years past had felt the necessity of transferring their school, at present situated at College Hill, to a more modern and convenient building, but considerable difficulty was experienced in finding a suitable site for the new school within the City boundary. In 1892, however, the company, through their surveyor, Mr. Daniel Watney, purchased the site of Barnard's Inn, Holborn, an area of 27,000 feet superficial, including the buildings standing thereon.

Amongst these buildings was the old Inn Hall, which the company decided to retain and make it part and parcel of the new school premises. In Maitland's "History of London," 1775, it is stated that the Inn was founded on this site in 1454.

The new school is a handsome building, faced with red bricks, with Ancaster stone dressings, but unfortunately it is largely hidden from view, as the entrances both from Holborn and Fetter Lane are so narrow. There are two entrances to the main block of buildings, and one of these is surmounted by a clock tower, in which a clock has been placed through the generosity of one of the members of the court of the company.

Approaching the building from Holborn it will be noted that the old Inn Hall has been retained and redecorated to be now used by the boys as a dining-room, and with this object kitchens, sculleries, &c., have been built in close proximity.

The head-master's room is adjacent to the dining-hall, and then the main block of buildings follow, with its large assembly-hall on the ground floor—a room 70 feet by 40 feet—with an arcade on its western side. On the same floor a large lecture-room is provided, and also the physical laboratory and science

master's room, and a special classroom for the head-master, Dr. Scott.

On the first floor are six large classrooms, and the second floor has a similar number. These rooms are lofty, and all well lighted from the left-hand side, with glass screens to the corridors. They are fitted with open warm-air stoves, and the larger rooms and all the staircases and corridors are heated with low-pressure hot water, which is also used for extract purposes in a large trunk placed on the roof. Under the lecture-room block a covered playground has been provided for the boys' use in bad weather.

A separate building of three floors, placed backing into Fetter Lane, contains the chemical laboratory and the drawing school, both of which are being fitted up with all the modern appliances.

The whole of the buildings are fireproof throughout, and they have been fitted both with fire hydrants and with the electric light, no gas-mains being introduced into the premises. The total accommodation is for 300 boys, exclusive of the lecture-room, laboratory and drawing school. The classrooms are being fitted with single desks, and a separate locker is provided for every boy's hat and coat. The drainage has received special attention, and the whole of the laboratories are situated in a distinct building in the playground.

As before mentioned, the site was bought by and all necessary arrangements with adjoining and other owners made by the surveyor to the company, Mr. Daniel Watney.

The builders who have carried out the works are Messrs. E. Lawrance & Sons, of Wharf Road, City Road, from designs prepared by Mr. T. Chatfield Clarke, F.R.I.B.A., under whose personal direction and that of his son and partner, Mr. Howard C. Clarke, the buildings have been erected. Mr. J. P. King has acted as clerk of the works.

THE fifth annual congress of the District Councils of Scotland in connection with the National Registration of Plumbers will be held at Inverness on the 18th and 19th September, under the auspices of the Provost and Magistrates of the burgh. The congress now announced will fittingly follow those held at Edinburgh, Glasgow, Dundee and last year at Aberdeen, under the auspices of the Corporation, the authorities of the colleges and chief citizens.

The Provost and Magistrates of Inverness were among the earliest health authorities in Scotland to officially recognise the great sanitary importance which attaches to plumber-work and house drainage being carried out by efficiently trained and responsible men, and they welcome the meeting in Inverness of the representatives of the plumbers and the sanitary authorities of Scotland, to consider practical measures for securing these objects and promoting those good relations which they are convinced should always subsist between those engaged in works intimately connected with the health and comfort of the community.

The following are the most important of the subjects which will be discussed during the congress:—

1. Publication of the model regulations concerning plumber-

work and house drainage which have been formulated since the last year's congress.

2. The importance of practical workmanship, and the extension of technical instruction classes for plumbers under municipal and county authorities.

3. The promotion of the Plumbers' Registration Bill in Parliament.

4. The Exhibition of Sanitary Apparatus and Teaching Appliances, &c., which will be opened in connection with the congress.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

16344. Alfred Edward Dawes, for "Improvements in fastenings for window sashes."

16345. Fred Walter Cashmore, for "Improvements in window-sash fasteners."

16396. Morris Ford Smith and Horace Pettit, for "An improved observation tower."

16457. William Cowper, for "Improvements connected with ranges, fire-grates and the like."

16458. Robert Frame, for "Improved means for opening sash windows."

16462. William Hodgson, for "Improvements in the construction of water-closets."

16480. John Halse and Oliver Reece, for "Improvements in sash fasteners, also applicable for doors and the like."

16564. Edward Clare, for "Improvements in fasteners for sashes, sliding doors and the like."

16577. Thomas Robb, for "Improvements in and relating to the lowering and raising of windows."

16646. Samuel Daw, for "Improvements in and relating to window-sash fasteners."

UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR, as Supplied to

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouse Factories, Workhouses, &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been enabled to spend my winters in England instead of on a foreign shore,—Yours very truly,

JOHN TYNDALL.

Dr. GRIEVES says:—

Buckhurst Manor, Wadhurst.

I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. should not like my house warmed with any other method, for I like plenty of ventilation and do not approve of stagnant air.

Book of Testimonials gladly forwarded gratis on application to

JOHN GRUNDY,

30 DUNCAN TERRACE, CITY ROAD, LONDON

And TYLDESLEY, NEAR MANCHESTER.

Telegrams:—"JOHN GRUNDY, LONDON."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

THE SURVEYORS' INSTITUTION (Incorporated by Royal Charter), 12 Great George Street, Westminster.

EXAMINATIONS, 1895.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of Students will be held on January 23 and 24 next.

It is proposed to examine Candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland, at Manchester. Candidates from other counties in England and Wales will be examined in London.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers and Building Surveyors (held under the provisions of the Charter), qualifying for the Fellowship and Associateship of the Institution, will commence on March 11 next.

Candidates for the Professional Examinations are examined in London only. Particulars as to subjects, course of examination, prizes and scholarships can be obtained of the Secretary.

All applications for the Professional Examinations, Divs. II., III., IV., and V., must be sent in before October 31 next, and applications for the Students' Preliminary Examination before November 30 next. The necessary Entry Forms for the various Examinations can be obtained of the Secretary.

TRADE NOTES.

A DRINKING fountain, in polished red granite, a gift to the town of Elland by Mr. John Dewhirst, of Woodlands, has been erected in the recreation grounds. It is quatrefoil on plan, having four basins, with a continuous flow of water issuing from bronze lions' heads, with an imperial crown, also in bronze. The designer is Mr. Swinden Barber, architect, of Halifax, and the work has been executed by Messrs. Earp & Hobbs, of Lambeth and Manchester.

WE are pleased to state that Messrs. Cousland & Mackay have just supplied, according to the instructions of Mr. James J. Farrall, architect, of Dublin, one of their "Climax" Ventilating Co.'s Direct-acting Turret Ventilators, Design S, for the ventilation of the Empire Theatre, Belfast. This ventilator is of very large dimensions considering its ornamental character, being 5 feet 6 inches in diameter, with a 3-foot 4-inch diameter ventilating shaft, measuring over all 16 feet in height and 6 feet 6 inches in diameter, having finials surmounted with gilt copper ball and crescents, suitable for the architectural style of the building.

WE hear that Messrs. H. Parsons & Harris, of Sidney Grove, E.C., have been successful in securing the contract for the hot-water heating apparatus to be supplied and fixed in the extensive new offices at Messrs. Wallace & Co.'s show-rooms, Nos. 151, 152, 153, 154 and 155 Curtain Road, E.C.

THE Church schools, St. Annes-on-the-Sea, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

TWO stained-glass windows and an elaborate memorial brass have just been erected in St. Augustine's Church, Highbury New Park, N., by some members of the congregation, to the memory of the late Rev. Gordon Calthrop, thirty

'SPHINX' PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1½ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving. "ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

Office: 175 Strand, London, W.C.

years vicar of the parish. The works have been carried out by the well-known firm of Alexander Gibbs & Co., of 21 Bloomsbury Street, W.C., by whom the large east window was executed some few years ago.

WE are informed that in sending us particulars of London tenders last week an omission was made in respect to the alterations, in which the name of the road was left out. It should be Nos. 593, 595 and 597 Old Kent Road.

THE Watford School Board have accepted the tender of Mr. Brightman for new schools, Leavesdon Road, at 4,095/.

LAST week we gave a description of the alterations made at Barnard's Inn, Holborn, to fit it for the purposes of schools for the Mercers' Company. We have pleasure in stating that the excellent fittings of the class and lecture-rooms have been supplied by Messrs. Geo. M. Hammer & Co., Strand, London.

VARIETIES.

THE Lybster waterworks, the first constructed by the Caithness County Council, have been formally opened by Mr. Miller, of Scrabster, convener of the county. The cost is about 1,000/.

It is stated that Mr. John Thomson Paton, of Norwood, has agreed to erect and equip a complete set of baths for Alloa, together with a gymnasium and furnished rooms for conversation and amusement, together with 3,000/ as an endowment.

THE Atherstone Board of Guardians have applied for powers to borrow 11,412/ for water supply purposes.

THE Stafford Town Council propose to borrow 42,000/ for carrying out works of drainage.

THE Torquay Town Council propose to expend 22,000/ for works in extension of harbour accommodation and the construction of a new promenade pier.

THE Leicester water committee have resolved to reduce their water supply to the public, the reason alleged being the absence of rain. No complaints on this score have been recorded from any other parts of the kingdom.

THE committee of the Leeds Corporation lately visited Kirkstall Abbey in company with Mr. Micklethwaite, architect, under whose supervision the works for the preservation of the ruins are being carried out. The committee inspected the large tower, which is about to be repointed, and Mr. Micklethwaite

was instructed to prepare plans for a new lodge and entrance gates. Up to the present time 5,500/ has been expended on works in connection with the Abbey and recreation ground, but that sum includes more than 1,000/ for adjoining land which was added to the recreation ground.

WE regret to announce the death of Mr. Robert Grierson, architect, Bangor, at the early age of thirty-five years. He was born in Dumfriesshire, educated at Dumfries Academy, and was a fellow-scholar of Mr. J. M. Barrie, author of "A Window in Thrums," and Mr. Jas. Thompson, the African explorer. He served his apprenticeship with a well-known firm of architects, and went to Bangor as assistant to Mr. Richard Davies, architect. Shortly afterwards he started in practice for himself, and was rapidly coming to the front in his profession. During his career he undertook several works of importance in Anglesey and Carnarvonshire. He was one of the four who obtained premiums at the last Bangor National Eisteddfod for designs of the proposed intermediate schools for Bangor, and had only just completed plans for the new schools about to be erected for the Llanrwst School Board.

THE fears of the people of Leighton Buzzard as to the threatened sale of their ancient market cross have, it is stated, for a time at least been set at rest. The cross was one of a number of lots to be offered in connection with the proposed sale by auction of the Stockgrove estate, but the properties failed to realise the reserve price and all the lots were withdrawn.

A DISASTROUS fire has occurred at the Kingsteignton Potteries Brick and Tile Works, situated about a mile from Newton Abbot. The damage done, which is covered by insurance, amounts to about 40,000/ or 50,000/. The works, which were commenced about five years ago, were owned by Messrs. Hexter, Humpherson & Co.

A RESERVOIR belonging to the Castleford Local Board has collapsed, situate at the top of Red Hill. The whole of the water, estimated at between 15,000 and 20,000 tons, mysteriously disappeared, and it was found that a "crack" at the bottom of the reservoir was the cause. The water had evidently found its way into the old workings of the sand-holes or pits which abound immediately under the site of the reservoir.

A WEALTHY American iron and steel master now in this country has announced that he and several friends are so satisfied of the prospects of tinplate-making in America that they are forming a private company to commence tinplate manufacture on a scale which will immensely increase the

present American output. A firm at Pittsburg who have been in close contact with the iron trade have also decided to invest 50,000*l.* in a tinplate works.

AT the meeting of the Stamford Town Council in committee a report on the drainage and water supply was submitted by Mr. R. H. Bicknell, engineer. He reported that the cost of excavation would be somewhat high, owing to the drains having to be laid for the most part in rock. A system of ventilation by means of manholes or lampholes is provided, and Mr. Bicknell proposes to construct five large arteries or storm-water mains, which will take in the whole of the storm-water, utilising as far as possible the existing drains for that purpose. He recommends the adoption of the "International" system of purification at the outfall works. With regard to the water-supply, Mr. Bicknell says there is abundance of water in the neighbourhood, which however is at present only partially used, and he estimates the cost of carrying out the drainage scheme at 30,000*l.*

BUILDING AND BUILDERS.

THE Local Government Board have authorised the erection of a hospital at Shooter's Hill by the Metropolitan Asylums Board at a cost not exceeding 200,000*l.*, and have sanctioned the borrowing of the money. A consultation is to be held concerning the proposal to build an imbecile infirmary on the Tooting Lodge Estate.

A PUBLIC meeting of the London County Council Employés' Labour Union took place in Battersea Park. The Secretary said it was claimed that the Council, by doing their own work in certain cases, saved the ratepayers' money. He believed that if a truthful account of the expenditure on some of these much-vaunted jobs was forthcoming it would be seen that the total cost was in excess of what an ordinary contractor would have charged. In the case of the York Road sewers various items of expenditure were left out of the accounts, such as the salaries of the heads of departments or the surveyors. Then there was little doubt that the work was not done so well as it would be by a contractor. The Secretary's revelation will not be a surprise to practical men.

THE premises occupied by the Institution of Civil Engineers in Great George Street, Westminster, are in process of demolition prior to being reconstructed. The premises on either

side will be added to the institute, and the theatre of the building, in which the meetings and discussions have been held in the past, will be renovated so as to harmonise with the new structure. The work is to be carried out by Messrs. John Mowlem & Co, builders, from designs of Mr. Charles Barry, architect, the estimated cost being about 40,000*l.*

The Glasgow Dean of Guild Court have granted the University Court authority to erect a two-storey building in Queen Margaret Crescent, Kelvinside, to be used as dissecting rooms and lecture hall for the medical classes at Queen Margaret College. The extension is estimated to cost 5,000*l.*

ELECTRICAL.

THE sub-committee of the Edinburgh Town Council on electric lighting have recommended to the Lord Provost's committee that a deputation of three members should go to London to select a lamp for public lighting in Edinburgh, several specimens having been fitted up at Westminster by the Corporation's consulting engineer.

THE Mersey Dock Board have decided to provide electric lighting installations at the new coaling jetty, Duke Street Bridge, East Float, Birkenhead, and at the Albert Dock warehouses.

AT the meeting of the Chester Town Council the following recommendation of the electric lighting committee was adopted:—"That the Water Tower Gardens, belonging to the Corporation, be the site for the proposed electric light generating station, and that the committee be authorised to proceed to establish the installation, submitting tenders, or terms of any proposed contract, to the council in the usual way."

AT the meeting of the watching and lighting and gas and electric committees of the Town Council, it was reported that the cost of the electric lighting of Union Street, at 7*d.* per unit, was 262*l.* 2*s.* 10*d.* per annum. The expenditure for gaslight over the same area was stated to be 70*l.* 5*s.* 10*d.* It was decided that the gas department should supply the current for street lighting at 2½*d.* per lamp per hour, the lighting committee to bear the cost of the carbon and maintenance.

AT a general meeting of the Bath Electric Lighting and Engineering Company, Limited, the following resolution was passed:—"That the City of Bath Electric Lighting and Engineering Company, Limited, apply during the present year to

OVER ONE HUNDRED PER CENT. PER ANNUM.

An investment bringing in such a return in these dull days is worthy of attention. In a letter to the **YÖST TYPEWRITER COMPANY**, of date April 4 last, Messrs. PRICE BROS., of Dudley, wrote:—

"As to the objection of first cost, all we have to say is that we saved the cost of our Machine in less than twelve months."

TRADE MARK

The Machine referred to as such an excellent investment was a **YÖST** Typewriter. The **YÖST** will yield you the same return that it has brought to Messrs. PRICE BROS.

the Board of Trade for a provisional order authorising the supply of electricity by the said company for all or any public and private purposes within the area of the city of Bath."

At the meeting of the Worcester watch committee, a letter was received from Mr. C. W. Dyson Perrins asking whether the committee could entertain the idea of supplying his premises at the top of Malvern Link with the electric light. He said he should require from 200 to 300 lamps, as well as one or two motors. A letter was also read from Alderman Day calling attention to the electric-light standards fixed in the city, which were an enormous obstruction. He suggested hanging-lamps or lights from brackets. He also complained of the transformers being fixed in the most objectionable places in the pavement, and unless very great care was exercised in protecting openings when the covers were off accidents would occur. The matter was referred to the sub-committee.

THE SHEFFIELD AND LONDON RAILWAY.

THE contracts for the new railway from London to Sheffield have now been let, with the exception of that part comprised within the Metropolis, where the works are particularly heavy, but this last one will be let next week, so that the work may be started at all points simultaneously. There are in all seven contracts, including the London one, which extends for only $4\frac{1}{2}$ miles from Marylebone through Lord's Ground, but it is all in cut and cover or in tunnel, and includes terminal station and hotel, the cost being put at about 550,000*l.* per mile. From Lord's the trains will run over the existing line of the Metropolitan Company to Quainton Road, 21 miles north of London. From this point the line runs generally straight north to Sheffield, only curving two or three times to cut through Rugby a little to the east, Lutterworth, Leicester, Loughborough and Nottingham. The first 25 miles of the line are let to a London contractor, Mr. J. T. Firbank, who thus has two contracts. The next 15 miles to Rugby have been undertaken by Mr. Thomas Oliver, Totley, near Sheffield. This length includes a tunnel, $1\frac{1}{2}$ miles long, at Catesby, which is perhaps the most difficult part of the work. There is also a heavy bridge over the London and North-Western Railway near Rugby. For 20 miles north of Rugby the line will be constructed by another London firm, Messrs. Topham, Jones & Railston, and this includes the work of tunnelling through Nottingham.

From East Leek to near Nottingham, the next 15 miles, the work will be done by Mr. Lovatt, Wolverhampton, and for the remaining length to Annesley, on the line to Sheffield, a Sheffield firm has the contract—Messrs. Logan. It is understood the contract prices come well within the Parliamentary estimate, which was 6,500,000*l.* for the whole works on the 112 miles of railway.

CLINKER PAVEMENTS.

In Edinburgh about fifteen tons of "clinker" are turned out daily in connection with the refuse-destroyer at Powderhall, and the question of its disposal, in respect of the enormous accumulation, has been exercising the minds of the authorities. Recently, says the *Scotsman*, the idea occurred to Councillor Sloan that the "clinker," which can be ground on the premises, might be utilised in forming the upper layers of pavement on the lines of the granolithic industry. That portion of the north side of London Road extending from one end of Hillside Gardens to the other was selected for the experiment, and there the work is now in progress in the hands of Messrs. John Baird & Son. Previously the pavement there was "hornised," and the stones have been used as the foundation for the mixture of "clinker" and cement. Naturally the "clinker" is of a darkish colour, but it is rendered somewhat lighter in tone through the use of chemicals; while by the aid of hematite the layers are alternately what may be described as blue and red. The layers are from 2 inches to $2\frac{1}{2}$ inches in depth. A portion of the work has been already completed. A few days ago it was inspected by Bailie Dunlop, convener of the streets and buildings committee, Bailie M'Donald and Councillor Sloan; and so far as it has gone, these gentlemen expressed themselves as highly satisfied with the experiment. Should this process of street paving prove in the end to be substantial, the chances are that, as already indicated, a considerable saving will be effected, because while granite chips cost from 14*s.* to 15*s.* a ton, "clinker" can be supplied at about 1*s.* per ton. Meanwhile, however, what is considered of most importance is the disposal of "clinker," and there can be no doubt that the experiment will be watched with not a little interest. Judging from present appearances the new process is likely to compare favourably with the old. The substance is strong and firm, and the blending of colour in the alternate layers gives the pavement quite an attractive look.

HEWETSONS, Tottenham LONDON, W.

HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

NOTES ON NOVELTIES.

THE engraving shows a new carbon gas lamp just introduced by Messrs. Joseph Ratcliff & Sons, of New Summer Street, Birmingham, designed on the model of their new Rapid lamp, which has been received with so much favour by the public. One principal feature has been the production in very improved character at a much lower cost of an underlight carbon lamp. It is excellently finished in chocolate enamel, or is nickel-plated to suit the purchaser's taste at the same price.

It also is fitted with a regulator which prevents any chance of smoking. It throws no shadow whatever owing to the lights being some distance below the container. An objectionable feature in some carbons was the fact of the nickel burning off. This is overcome in the new Rapid by its having a strong opal glass reflector which keeps off the heat from plated parts. An inspection of the actual article will not fail to convince a customer of its merits.

THE accompanying engraving illustrates one of the prettiest stoves just lately put on the market. The design has been

arranged with a view to its being in harmony with its surroundings, and also more particularly to suit the prevailing taste at present for artistic bamboo furniture. For this, the latest idea in

gas-stoves, the public are indebted to the enterprise of Messrs. Arden, Hill & Co, gas engineers, Lichfield Road, Birmingham. It is brought forward at a seasonable time, when householders are preparing for winter requirements. It combines all the latest improvements, and it cannot fail, we think, to give great satisfaction in every way, not only from an artistic point of view, but from fulfilling the functions of a reliable warming apparatus.

THE KENSINGTON WHEEL.

THE great wheel at West Kensington is progressing, and will no doubt sooner or later be completed. The summer, however, has been very unfavourable for rapid work in an undertaking of this nature, and it is pretty evident that there will not be much spinning round this summer. All the real difficulties of the task, says the *Daily News*, have been successfully overcome, and what remains is tolerably easy and straightforward. The ponderous axle, 40 feet long and 53 tons in weight, has been successfully hoisted to its position on the top of the iron supports that stand 150 feet high. This was a very anxious piece of business, but it was accomplished without mishap of any kind; indeed, it is a fact very creditable to the young resident engineer, Mr. C. F. Hitchins, that no accident has happened in connection with this wheel from the outset. It was hoped a month or two ago that, the axle once in position, the building of the rest of the wheel might be carried on with such rapidity that it might have been got to work before the end of the holiday season. That is clearly out of the question, and the fact that the experiment of setting up the electric light and carrying on the work by night as well as by day has been abandoned shows that there is no longer any expectation of being ready for the public this summer. The overtime working was found to be extremely expensive and very unsatisfactory in result, and, moreover, there was all the while considerably greater liability to serious accident. The construction of the spokes and rim of the wheel is now in progress. Of thirty-nine sections two are now finished, and the advance is at the rate of almost one a week. Things may go faster when the greater cycle has been further developed, but it is hardly probable that anything can be ready for the public at all events before the spring of next year. It is stated that Messrs. Brown, Marshall & Co., of Birmingham, have completed all the carriages to be suspended from the wheel, and one complete specimen, a handsome and elaborately decorated saloon capable of holding forty people is now on the ground. Although the carrying out of this unique undertaking is very considerably in arrear of what had been expected, its progress has really been very rapid. It was begun only last March, and its completion by next March will be a very smart feat of engineering, whatever the West Kensingtonians may think of it as a sort of revolving sky-sign set up in their midst. It would no doubt have been more satisfactory to see the same amount of capital and engineering skill devoted to a more useful purpose, but so long as there are

boys and girls to be amused, and sweethearts to be treated, and country cousins to be astonished, and Yankees to be "licked," no doubt these things are, in a certain restricted sense, necessities of life.

REGISTRATION OF PLUMBERS.

THE fifth annual congress of the district councils of Scotland in connection with the national registration of plumbers opened in the Town Hall, Inverness, on Tuesday. Provost Ross presided, and was supported by Sir Stuart Knill, ex-mayor of London and master of the Worshipful Company of Plumbers; Professor Glaister, Glasgow; Professor Matthew Hay, Aberdeen; Professor Macadam, Edinburgh, and others. Provost Ross, in welcoming the delegates, expressed special gratification at the presence of Sir Stuart Knill, and said the congress could not fail to do much to forward sanitation in the North. Sir Stuart Knill acknowledged the welcome, and said that he had always felt a deep interest in the matter of sanitation, especially in regard to plumbers. He was there as Master of his Company, by desire of his Fellows in the governing body, to pay respect to the plumbers of Scotland. The object of his visit also was to ascertain for the benefit of his company what were the wishes and proposals of the plumbers of Scotland. What the plumber desired, he presumed, was to make his trade respected as it ought to be and as it once was; he wanted to get rid of those men who did dishonour to the trade, men who started as plumbers and sanitary engineers without knowing one particle about the science of the trade. On the motion of Mr. Gordon, Glasgow, seconded by Councillor King, Glasgow, the model regulations and by-laws for the drainage and plumbing work of buildings were approved. Sir Stuart Knill considered that if the registration movement, which had been set on foot in London, resulted in nothing else than the adoption of similar regulations, they would be able to congratulate themselves upon having achieved a great work.

THE NEW METROPOLITAN BUILDING ACT.

SOME of the anticipated effects of the new Act are explained as follows by Mr. W. Wallace Bruce, a member of the London County Council:—Up to the present time, so far as central London is concerned, the Acts in force regulating the building of dwelling-houses have left the builder practically free to put

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 1, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installation.

THE INCANDESCENT GAS LIGHT CO., LIM,

14 Palmer Street, Westminster, London.

up what dwellings he pleases, utterly regardless of any considerations as to whether the rooms in these houses will have sufficient light and air to make healthy human life possible. This absence of adequate restrictions has resulted in the frequent erection of dwelling-houses which are a disgrace to any community boasting of sanitary knowledge. I will give a few examples of what has recently been perpetrated. In one case a block of buildings of five storeys has been erected and two or three families are living on each floor, yet at a distance of only 6 feet behind this block stands a warehouse 50 feet high, which excludes the light and air from all the back rooms of the dwelling-house, and the children growing up in them are like plants in a cellar. In another case only 3 feet of space has been left behind a block of recently-erected dwellings, and the owner of the adjoining land has it in his power to replace the old cottages which are now standing there with lofty warehouses or block dwellings and so entirely exclude all light and air from the buildings in question. These are only two typical cases of what is going on over a large portion of London; many rooms have to be lighted by gas at noon on a bright sunny day. For the future the building of such dwelling-houses will be rendered impossible by an Act of Parliament promoted by the London County Council, which has just become law. This Act provides that the space in rear of all dwelling-houses to be built for the working classes shall be in proportion to the height of the house, and fixes the minimum size of the courtyard at the back of the house at 150 square feet, and the depth from front to rear of such court at not less than 10 feet. It may be asked why so wholesome a provision is limited to the working classes so far as central London is concerned.

The answer is that in the committee of the House of Commons to which this Bill was referred, the opposition to a whole roomfull of counsel engaged to oppose this Bill was so severe that it was only possible to secure this provision by limiting it to those cases where the evils resulting from the present law are most apparent. Another part of this Act will remedy a glaring inconsistency in the present law. There are parts of London covered with long, narrow alleys, 9 feet to 12 feet wide, in which the old two-storey houses are being condemned as unfit for human habitation. The Building Act in force up to the present time allows these houses to be rebuilt up to the height of 90 feet without requiring the alleys to be widened. It is true the rookeries thus constructed could be condemned under the Housing Act of 1890, but full compensation would

have to be paid by the ratepayers of London to the owner who had perpetrated this iniquity under the sanction of the law. How great is the cost of such compensation is shown by the result of the Boundary Street clearance in Bethnal Green. In this case an area of 15 acres of narrow alleys and courts of old buildings was cleared by the Council under the Housing Act of 1890 and the net cost, after taking the value of the cleared land as an asset, has been about 280,000/. The Act just passed remedies this evil by providing that in streets of less than 40 feet wide, only houses of a height not exceeding the width of the street or alley shall be built for the working classes.

These two provisions, taken together, will remove one of the greatest obstacles to the putting in force of the Housing Act of 1890 and part of the Public Health Act of 1891. So long as it was possible to rebuild houses condemned under these Acts to such a height that they were even more unhealthy than before, there was a reason for the local authorities hesitating to put these Acts in force. In future that very good reason can no longer influence them.

There yet remains the grave question, What is to be done with the excess of population in those districts which are so overcrowded that it is impossible to rehouse on the spot under healthy conditions all the people who are now living there? The only solution appears to be the supply of some cheap means of conveyance to and from less crowded districts, where the lower rents will enable them to pay the cost of transit to their work; whether this can best be done by electric railways is a question well worth the attention of engineers.

The community are not aware of the loss annually suffered from the present state of the dwellings of the working classes in central London. Thousands of children are growing up with deficient vitality, and will become a charge on the public in hospitals, asylums and workhouses, and will go to form that most hopeless section of the unemployed—those who, though willing to work, are unable through want of vitality to do a good day's work in return for fair wages.

At the meeting of the Mersey Dock Board the suggestion of the works committee was agreed to, to erect a wooden fence, &c, between Canada Street and the yard occupied by Messrs. Farnworth & Jardine, to the north of the North Carriers' Dock, at an estimated cost of 455/.

THE BETTERMENT QUESTION.

(Concluded from last week.)

THE following is the report prepared by Mr. Clare, the deputy town clerk of Liverpool:—

Betterment.

At the commencement of their inquiry into this subject, the committee have been met by the difficulty of ascertaining exactly what is meant by the term "betterment."

As far as can be gathered from the speeches and evidence of those who advocate "betterment," the general principle seems to be that where a street improvement is carried out at the public expense, which has the effect of increasing the value of any particular property, a portion of that increased value shall be taken by the public from the owners of the property. But, when the Bills which have been introduced in Parliament to carry out the principle are examined in detail, it will be seen that "betterment," in its proposed application, is a very different thing from the general description of it.

The committee propose, in the first place, to examine into the merits of the principle itself; then to show the nature and effect of the provisions in the Bills dealing with the subject; and, lastly, to explain their own views and recommendations as to altering the law, so as to enable the public to obtain a share in the unearned increment in land.

The principle of "betterment," as generally proposed to be applied, has hitherto been confined to placing a special tax on land actually increased in value by street improvements which may be carried out in future; but it seems to be assumed that the increased value will only be given to land immediately in the neighbourhood of each street improvement, and that, therefore, the application of the special tax is to be limited to some defined area adjoining the works to be carried out. It further appears to be assumed that a street improvement does necessarily increase the value of land in the neighbourhood, and that, therefore, some substantial benefit will accrue to the public from the imposition of the special tax.

On these points the committee have the following observations to make:—

Assuming it is possible to specify the increased value accruing to land as a direct consequence of some particular expenditure out of public funds, there seems no logical or sound reason for selecting the increment arising from that par-

ticular expenditure as a subject for special taxation, while the increment arising from all other expenditure is left exempt from special taxation.

Therefore, if the principle of levying a special charge on land for exceptional benefits accruing to it is adopted (which "betterment" involves), it is giving the public but a small portion of what they are entitled to if they are only to levy the special taxation on the increment arising from street improvements.

Next, in the case of property which increases in value after a street widening has been carried out, how can it be ascertained whether that increase is owing to the carrying out of the widening or to the development in the trade and population of the town, which, in itself, creates a demand for land and consequently adds to its value? For instance, supposing the demand for trade premises and offices in some particular district of a town is rapidly increasing and rentals in that district are generally rising, and that, during the period of this rise in land values the corporation decides to widen one of the streets in that district. Suppose, also, that the increase in values continues during, say, the four or five years which will elapse before the widening is completed, can it be fairly said that the increase in values between the date when the corporation deposits their plans for the improvement, and a date, say, two years after the works are completed, is owing to the expenditure incurred on the street widening? And if not, how is the increase to be apportioned? But betterment requires it to be done.

If land is increased in value owing to the energy and enterprise with which the ratepayers in a town carry on their trade or business, and to the general good government and judicious expenditure of public funds by the corporation, the ratepayers should be just as much entitled to a share in the increment arising from those causes as if the increase in value happened to follow some particular expenditure on a street improvement carried out in order to give greater facilities for traffic, and to enable the trade and business of the town to be more advantageously conducted.

There does not appear to the committee to be any logical reason for limiting the right of the ratepayers to share in the increase arising from one particular class of expenditure only, even assuming that increase is capable of being ascertained.

Then as to the limitation of the area for imposing the tax.

In the Metropolis the demand for land is such, particularly in certain districts, that whenever a new street is cut through a

SPECIAL ATTENTION GIVEN TO ARCHITECTS' DESIGNS.

built-up district, or a street is widened, the frontages at once command a market value probably greatly in excess of the value of the land previous to the improvement, but, more probably than not, other property a distance away will also be much increased in value, owing to the effect that the improved facilities for traffic may have upon it, or possibly owing to the displacement of trades and population caused by the improvement itself, and which have to find location elsewhere.

It seems contrary to the true principles of taxation in such a case to impose a special tax on the one property and exempt the other.

But the Metropolis must not be taken as the criterion for gauging the effect of "betterment" in provincial towns.

The experience of the members of the committee in their own towns is that, as a general rule, a street improvement, which involves the acquisition and pulling down of a large number of business premises or dwelling-houses, so dislocates the trade on the line of street, either by the compulsory removal of trades, or by depopulating the district, and so taking away the customers from the shops in the neighbourhood, that it takes many years for the property fronting the street to develop or for the property adjoining to recover.

The slow development of frontages to a new or widened street has been, as a rule, the painful experience of corporations where they have purchased sufficient land so as to have the frontages to the new street to sell themselves, which has proved that "recoupment" is a mistake financially.

Of course, if a new street is made which opens up a new district for building purposes, the land in the immediate neighbourhood is naturally increased in value; and if it happens that, at a time when there is a considerable increase in the trade of a town, a street widening is carried out in a district suitable for trade purposes, then (if "betterment" does not stand in the way) the frontages of the widened street would probably be quickly developed by the owners, or sold to builders at enhanced prices. But, speaking generally, experience in provincial towns shows that street widenings do not for some years improve property in their immediate neighbourhood so much as property in other parts of the town, and that it often takes many years before the frontages to a new or widened street become fully developed.

Moreover, the "betterment" principle is only proposed to be applied in cases where corporations obtain powers to carry out street improvements in future, and therefore no advantage will be gained by the public in respect of capital already spent,

and which in some towns has, perhaps, amounted to so large a sum as to practically prohibit further expenditure for some years to come.

It is now proposed to consider the provisions of the London County Council Bill and the Manchester Corporation Bill of this session relating to "betterment."

The provisions of both Bills are practically identical, except with regard to the terms for redeeming the proposed tax.

The preamble to the clauses recites that the street improvements "will or may substantially and permanently increase in value lands in the neighbourhood of the above-mentioned street improvements which will not be acquired for the purpose thereof, and it is reasonable that provision should be made under which, in respect or in consideration of such increased value, a charge should be placed on such lands;" and then the first clause goes on to provide that the corporation, on the deposited plans for the improvement, shall show the limits of the land which will or may be so increased in value. No land outside the limited area is to be charged, no matter how much it may be increased in value.

It often takes several years to acquire all the land for a street improvement and complete the works, unless all the lessees and tenants are compensated at great cost, and during that period many changes may take place in the course of the trade and circumstances of a town, and it is highly probable that the area shown on the plan will contain property very much depreciated by the works, and will exclude property most benefited.

It is mere guess-work to attempt, several years before an improvement is carried out, to fix the area of property that will be improved.

The charge to be imposed on the land within the limits is then to be assessed by the Corporation "as soon as conveniently may be (but not later than seven years) after the passing of this Act." Assuming that the works are completed within seven years from the passing of the Act (which is by no means certain, particularly as no limit of time for completion is fixed), and assuming that the particular improvement is one most likely to immediately encourage new building schemes, is it not probable that within the year or two that may remain of the seven after the street is completed the owners of land within the betterment area will refrain from developing their property, and builders from buying the land, if they know that any sign of developing the land will be used as an argument for increasing the betterment tax? Consequently the question

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

as to what figure is to be taken to represent the increase in value to the land caused by the improvement will then be a matter of estimate by the Corporation, subject to appeal to an arbitrator. But the probability is that in the majority of cases in provincial towns there will be no exceptional demand for property within the betterment area during the first few years after the improvement is completed, and no desire on the part of owners to rebuild.

In cases where only one side of a street is pulled down, the improvement (if any) to the property on the other side will probably only arise to a small extent during the period of seven years, by enabling owners to get better rents for the buildings as they exist, and the buildings will generally have to be pulled down and rebuilt before the full increase in value to the land can be ascertained.

As the betterment charge, when imposed, will be a permanent taxation (subject to redemption), and will continue even if the shifting of trade from the neighbourhood at a later date may cause the property to depreciate below its value before the improvement was carried out, an arbitrator is not likely to be hard upon the owners by imposing a substantial tax upon their land for a hypothetical benefit which after all may be never realised, or be only temporary, and the result will probably be that after a great deal of trouble and expense the "betterment" charge over the whole area will not give any really substantial relief to the rates. In any case it will be a speculation between each owner and the public, by which either the owner will have his property taxed unfairly and unequally, as compared with the property of other owners, or the public will not get the amount they are entitled to.

It seems to the committee to be objectionable in principle that taxation should be based on an estimate of benefit which may arise in future, and not be limited to some benefit which has arisen and is present at the time the taxation is imposed; and, moreover, local taxation, to be equitable, should fluctuate with the value of the property to be taxed, and not be permanently fixed on what may be the estimated value of the property in some particular year. If every owner of property situate within the betterment area were obliged to sell his property within a given time after the works were completed, then, if it could be clearly shown that each owner had made a profit of, say, 1,000% by reason of the improvement, a portion of that sum might be fairly taken by the public; but the majority of owners will not sell, and then their profit is represented by the increased annual value of the land and not by a

capital sum. If then in the course of a few years the increased annual value at first accruing become reduced, it seems unfair to impose on the land a permanent tax based on an annual value that has only been maintained for a few years. Conversely, if the annual value further increases, the property should bear a higher tax proportionately.

As before pointed out, the fear of increasing the permanent tax on the land will prevent the early development of the property within the limited area which otherwise might take place; the assessments will therefore not increase, and the public will lose the rates which the property would bear if it were at once developed.

Putting aside the objections pointed out to "betterment" as proposed to be applied, it seems to the committee that in provincial towns the application of the principle would practically be of very little advantage to the ratepayers (save in exceptional cases), and no town will gain the slightest benefit from it until it has at some future date obtained an Act of Parliament to carry out a street improvement and has completed the works.

It is unnecessary to point out to members of the Association the increasing difficulty there will be to get the promotion of a Bill including "betterment" through a ratepayers' meeting and subsequently through Parliament if a powerful owners' association is formed in each town to protect their interests.

What the public want is some means of acquiring property at fair and reasonable prices for all public purposes without having to pay the exorbitant compensations for loss of prospective value which owners now get, and thus save in the original outlay, instead of trying to get back a portion of a larger outlay in the shape of "betterment."

With regard to the question of acquiring land for public works at fair prices, it is not proposed that an owner should be prevented from claiming all the compensation he is now entitled to claim under the Lands Clauses Act, but the committee recommend that the Act should be amended so as to enable the local authority, where an owner whose land is being acquired claims compensation for the prospective increase in the value of the land, to contend, by way of set-off to the owner's claim, that there will be a prospective increase in value accruing to property adjoining and remaining in the possession of the owner, and that the effect of the works for which the land is being acquired may be taken into consideration.

In conjunction with this the Act should be further amended to enable local authorities in all cases, if they think fit, to acquire only so much of any property as is actually required

WORKS, ROTHEBHAM. Estab. 1854.

for the works, on paying such compensation for severance as the owner would be entitled to get after the alteration in the law before suggested has been made.

Provision might also be made that the sum payable for compulsory purchase (over and above the price) should be limited to 5 per cent. on the price, instead of the customary 10 per cent., and that the liability to pay the costs of the inquiry to settle disputed compensation should be in the discretion of the jury, arbitrator or umpire, as the case may be.

If these amendments in the law are made, there would be a considerable saving to local authorities in the compensation to be paid for land required for all public works.

On the general question of the more equitable adjustment of local rates as between different properties within any given rating area, the committee recommend the following principle for adoption on which to found legislation, viz. :—

That the ratepayers have a right to appropriate for public use a portion of the increment in land as and when that increment arises, quite irrespective of the cause which produces it.

The application of this principle involves two main considerations :—First, the method for ascertaining the increment ; and secondly, fixing the proportion which the public ought fairly to appropriate.

With regard to the first point, the present law, by which rates are levied on the annual value of property, to a large extent provides an equitable method, but owing to the method of ascertaining the annual value many properties escape the burden of a fair share of the rates.

It is impossible to adjust local taxation with absolute equality, so that every ratepayer shall pay in exact proportion to the benefit he derives from the expenditure out of the rates.

"Betterment" theoretically is an attempt to carry out such an adjustment as regards a certain class of expenditure, but in its proposed application it will leave the incidence of local taxation as unequal, if not more so, than it is at present. Moreover, if the principle is adopted of imposing special charges on certain property in respect of the benefit which that property receives from the expenditure of money for the good of the inhabitants of the whole area, over and above the proportion of the benefit received by other property in the rating area, then the same principle should also be applied to all kinds of expenditure, and not be limited to one special class.

The increased value given to some properties in a town by new waterworks or main drainage works or improved paving is, in proportion, far in excess of the benefit derived by other

properties, but it would be impossible to pick out all the properties which specially benefit by each class of expenditure and impose a special charge on them which would equitably adjust the contribution to the expenditure on those works.

Why, then, should certain property which is increased in value by a street improvement be charged with an extra rate for the benefit of all other property within the rating area, when no extra rate is charged on other property specially increased in value by expenditure on other purposes, and which if charged would go in relief of the property, subject to the extra rate for the street improvement? That is not an equitable adjustment of rating.

The only practical basis for imposing local taxation equitably is to assess all property on the same basis, and to see that no property escapes being assessed at its real value, and this if properly carried out will, if all rates are levied on the assessment, as between the different classes of property, adjust the inequalities of local rates as far as practicable.

Some property no doubt benefits more in proportion than another from any given item of local expenditure, but the advantage gained on one item must be set off against the disadvantage on the other items, unless the impossible is attempted by trying to adjust local taxation in exact proportion to benefits received from local expenditure.

Under the present system of assessing property only those owners who have fully developed their property have the increment in their land fully assessed. The owners who retain their property in an undeveloped state, and neither sell it nor spend money in developing it, prevent the public from having the benefit of the property being utilised for purposes for which it is suitable, and at the same time are accumulating in the shape of unearned increment wealth which is capable of being realised into a capital sum if they choose to sell, or capable of producing an annual income if they choose to develop, without their property being subject to bear its fair share of the local taxation. This arises from the fact that the basis of assessment is the annual value of the property in its present condition, and although by reason of expenditure out of the rates the property referred to has been placed in a position of being capable of being developed to the best advantage, and owing to the demand for land the market value of it may have become increased tenfold, still it is probably assessed at about the same amount as it was when the market value was one-tenth of its present value.

The public lose by not getting the rates from the land which

it ought to bear, and as between one owner and another the assessment is inequitable.

If an owner chooses to allow his investment in land to remain unchanged because he thinks the capital value of the investment will increase he has a right to do so, but his land ought not to escape proper taxation in proportion to its varying value on that account.

The committee, therefore, recommend that the law of assessment should be altered so as to enable all land to be assessed on an annual value based on the real market value of the land from year to year; and that in the case of land and buildings the assessment should be arrived at by adding the annual value of the land. Under this system property which is fully developed will bear the same assessment as under the present system, but the owner who will not allow his land to be developed will have the land itself assessed on the same basis that the adjoining developed land is assessed, assuming that in both cases the real capital value is the same.

In this report the committee do not propose to do more than give this general outline of the scheme, but it may be added that they see no practical difficulty in carrying it out in detail.

With regard to the portion of the unearned increment in land which the public should take, it appears to the committee that when land is properly assessed in the way indicated, the contribution made by each property in the shape of rates is a fair sum, and to attempt to levy special charges on actual or estimated exceptional benefits, by a process which involves the exercise of a discretion by an elective body or by an arbitrator, must lead to inequality and uncertainty in its application.

If the alterations in the law proposed in this report are carried into effect, a very considerable benefit will immediately afterwards accrue to the ratepayers in every town, and the committee, while fully appreciating the efforts of those who have attempted through "betterment" to bring about a more equitable adjustment of local taxation, think it will be better for the corporations, who are members of this Association, to devote their energies to carrying through these amendments in the law which will be of some real use to every corporation in the country, rather than spend time in advocating a principle which, if adopted by Parliament, will, under the most favourable circumstances, only be a comparatively small advantage to a few corporations who in future obtain Acts of Parliament for street improvements, and years may elapse before even that advantage will accrue.

THE DECAY OF THE IRON INDUSTRY.

AN important article on this subject has been contributed to the *Times* by a correspondent. The statistics of the production of pig-iron for the first half of 1894, which have this week been issued by the British Iron Trade Association, show, he says, that although the output for that period was more than for the corresponding half of 1893, it is still much behind the output of a few years ago. On the other hand, it is a subject for both surprise and congratulation that we have again recovered, at any rate for a time, the supremacy in the production of iron which in 1890 we resigned in favour of the United States, and stand once more at the head of the iron-producing nations of the world in the matter of output.

In order that the circumstances of the British iron trade in reference to production may be appreciated, we append the statistics of the output for each of the years 1883 and 1893:—

	1883.	1893.
	Tons.	Tons.
Production of pig-iron	8,490,000	6,830,000
" " manufactured iron	2,730,000	1,364,000
" " Bessemer steel	1,553,000	1,493,000
" " open-hearth steel	455,000	1,456,000
Totals	13,228,000	11,143,000

These figures show that in spite of an increase of more than a million tons of open-hearth steel in the interval the total quantity of material produced fell off to the extent of considerably over two millions of tons, the decrease being more especially noticeable in pig-iron and manufactured or wrought-iron. The decline in the latter branch of the trade is not, however, so much a matter for anxiety as the wrought-iron industry has been a decaying one for years, and its decay has been almost as marked in some other countries—and more particularly in the United States—as in our own. It is the enormous absolute decline, as compared with the previous corresponding period, that specially arrests attention. Between 1873 and 1883 we increased the output of our iron and steel works by 3,268,000 tons, or 33 per cent., while in the period 1883-93 we fell off by 2,085,000 tons, or 16 per cent.

If these facts stood alone they would be sufficiently alarming, but unfortunately they are allied to other facts that are perhaps still more likely to excite apprehension. In 1883 our

Office: 175 Strand, London, W.C.

total exports of iron and steel amounted to 4,043,000 tons, valued at 28,590,000*l.*, whereas in the year 1893 our corresponding exports only reached 2,911,000 tons, of the declared aggregate value of 20,609,000*l.* It is a somewhat remarkable coincidence that the decline of 1,132,000 tons in the volume of our exports exactly corresponds with the total quantity of the exports of iron and steel from Germany in the year 1892. This, however, does not mean that the German exports have grown to this extent, or even at all, during the period in question. On the contrary, it appears that the total volume of German exports of iron and steel in 1883 were, like those of our own country, larger than in 1892, but the Germans in the interval have greatly improved their position by exporting less of pig and more of finished iron and steel. The same remark applies to Belgium, our next most important competitor, which exported 434,000 tons of iron and steel in 1883, as against only 406,000 tons in 1893. But while other countries have also diminished their exports, as between the two periods, it will be observed that the falling-off in the exports of British iron and steel is much larger than in the other cases referred to. It is manifest, in short, that the world has been consuming a greatly-reduced volume of iron and steel, and probably it was largely inevitable that Great Britain, as the chief exporting country, should be the greatest sufferer thereby.

This circumstance, however, does not adequately or satisfactorily account for two other facts of fundamental importance—the first that the production of British iron and steel has largely fallen off relatively to that of other countries, and the next that the imports of iron and steel into Great Britain have largely increased relatively to the exports of the same class of goods from that country. The imports of manufactured iron and steel may be classed in three categories—the first being Swedish bar iron from the crucible steel industry, which we import to the extent of nearly 100,000 tons and to the value of about a million sterling a year, and which, being purchased merely for the sake of its extreme purity, is imported quite apart from considerations of competitive prices, &c.; the second being beams, girders and pillars received chiefly from Belgium and imported because of their cheapness; and the third being miscellaneous manufactures of iron and steel—such as wheels, tires, axles, wire and castings, which we mainly receive from Germany, and which again are imported because English firms cannot produce them so cheaply as they can be imported. England still leads the world in the production of cheap pig-iron, which is the basis of the whole super-

structure of iron and steel exports, but we have of late years been falling behind in the economical production of the finished forms of the material, where cheap labour becomes the principal factor to be reckoned with. Continental producers have, in addition to cheaper labour, the further advantages of cheaper railway freights, cheaper shipping charges, and cheaper methods of placing their orders. Finally, it is an open secret that in German competition, at all events, contracts are often made at less than the actual cost of production. In other words, the Germans, being protected in their own markets by a virtually prohibitory tariff, and being thus enabled to depend upon remunerative prices at home, find that it serves their purpose to keep their works as far as possible fully employed and take what prices they can get outside for the balance not consumed at home. In this way the Germans have for many years past had two scales of prices—one for home markets, which was relatively high, and another for outside markets, which was relatively low. English manufacturers are, therefore, not always beaten on their merits, and this system of what they call unfair competition has been a sore point for a number of years past—the more so that the case becomes worse instead of better. It was made the subject of a bitter complaint on the part of the President of the Iron and Steel Institute in his last presidential address to that body, and it was afterwards dealt with in a severe article by a writer in the *Kölnische Zeitung*, who retorted that England had no reason to complain of unfair competition on the part of other countries, seeing that in a large number of specifications drawn up for orders for English and colonial railways for the English Admiralty and otherwise, foreign iron and steel were expressly excluded. The whole question has, in short, entered upon the phase and assumed the dimensions of a pretty little quarrel, and has tended somewhat to strain the usually seemingly cordial relations of the metallurgists of the two countries.

Shipping charges have of late tended to prejudice the English iron industry almost as much as high rates of railway freight. It is an open secret that for a considerable time past there has been a shipping “ring” at work, which has kept up a specially high range of shipping freights from English ports, so much so that English shippers have often found that they could do better by shipping *via* Hamburg or Antwerp than by shipping from London or Liverpool. Antwerp and Hamburg rates are at least 5*s.* per ton below those of London, while in Liverpool the steam rates are always the London rates *plus* the cost of carriage from works to London, or say, 7*s.* 6*d.* above the

rates from the Thames. At this moment German firms can ship to Australian ports at 5s. per ton less than English firms can ship from English ports, and this fact has greatly assisted the Germans in their competition with the English iron trade in Indian and colonial markets. And the worst of it is that in consequence of some firms having recently joined the "ring" that had hitherto kept aloof from it, the rates from most of the English ports have recently been advanced by from 15 to 30 per cent. In the South American trade, again, English steamers complete discharging at Antwerp and begin their loading at that port, and they are willing to take freight at rates from 2s. 6d. to 5s. below the rates that English manufacturers have to pay by the same vessels when they come to Liverpool to complete their loading. In the matter of shipping, moreover, German firms have had a considerable "pull" by the opening of the Manchester Ship Canal, which enables them to send finished wire right into the heart of Lancashire for less than it costs the numerous wire-making firms in Manchester and Warrington to produce it.

There is, however, another cause of the decay of the iron and steel industries of Great Britain that is at least as potent as any that have yet been named. The attitude and action of labour has of late years placed English manufacturers at a very serious disadvantage. This has been especially the case during the last three years, chiefly owing to the great coal strikes in Durham, the Midlands and Scotland. The Durham strike of 1892 caused the make of pig-iron in Cleveland to fall off by 685,000 tons, and that of Cumberland and Lancashire by 245,000 tons, as compared with the previous year, which means a reduced output in those districts alone of 930,000 tons, and a money loss to the pig-iron industry, as such, of more than two millions sterling. The strike of miners in the Midlands in the following year caused the output of pig-iron in the Midland iron-making districts to fall off by 360,000 tons, and led to a drop of 193,300 tons in the output of Scotland, in consequence of the Scotch ironmasters finding it to be more to their advantage to send their coal into England while prices were high than to use it in the manufacture of pig-iron. Finally, the Scotch miners' strike now pending is understood to have caused for the time being a complete paralysis of both the pig and the finished branches of the trade, practically all the iron and steel works, as well as the great majority of the blast furnaces, having been laid off entirely, and production having thus been brought to a complete standstill. These periodical labour crises do great permanent injury to trades that are so vitally

affected by them as the iron and steel industries, apart from the immediate and direct losses involved, and it is greatly to be feared that this cause has at least had as much to do with the serious collapse of our iron and steel industries as the outside influences that have been less under our own control. This mischief has a threefold character. Apart from the loss that is caused at the moment, such strikes discourage capital, prevent our manufacturers from fulfilling contracts, and entail the requirement of a higher return, where that is possible, for the risks involved, thereby raising more or less permanently the cost of production and increasing our disadvantage in outside competition.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

THE "MONOPOL" Fire Extinguisher

FOR MANSIONS, PRIVATE HOUSES, HOTELS, HYDROS,
RESTAURANTS, CLUBS, PUBLIC INSTITUTIONS, &c.

MADE IN VARIOUS SIZES.

Light and Portable. The smallest size, which contains Five Gallons, is particularly suitable for extinguishing small outbreaks of Fire. Larger sizes, containing Eight, Ten, and Twelve Gallons, are particularly adapted for Public Institutions, &c. The general appearance of the "MONOPOL" is artistic and strongly built and not likely to get out of order. Architects are invited to specify the "MONOPOL" for the above purposes.

PRICES AND PARTICULARS ON APPLICATION TO

MACINTOSH & CO., Wool Exchange, Coleman St., E.C.

GREAT WESTERN RAILWAY.—Oct. 9.—For the Reconstruction of the Gower and St. Austell Viaducts, situate between St. Austell and Burngallow Stations, and for Earthwork in Connection with the Widening of the Line between those Points. Mr. G. K. Mills, Paddington Station.

GREAT WESTERN RAILWAY.—Oct. 9.—For Building Waiting Rooms, &c., Baschurch. The Engineer, Shrewsbury Station.

TOTTENHAM.—Oct. 2.—For the Erection of Boundary Fence Walls, Fences and Gates at North-Eastern Fever Hospital. Messrs. A. & C. Harston, 15 Leadenhall Street, E.C.

WINCHMORE HILL.—Oct. 5.—For the Erection of a Double Pavilion and Additions to Laundries at Northern Fever Hospital. Mr. T. Duncombe Mann, Norfolk House, Norfolk Street, W.C.

At the meeting of the Bridgnorth Board of Guardians, it was reported that the visiting committee had thoroughly gone into the matter of the proposed alterations. It was proposed that for the roof over the labour cells slate be substituted for concrete, and that the cells be paved with half-blue bricks, and that there be a Yorkshire stone staircase instead of concrete. It would save about 50%. The tender of Messrs. Bickerton & Maddock, contractors, Shrewsbury, for 1,890*l.*, it was decided should be accepted subject to certain modifications, if necessary.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture. Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved,

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208. Special thrust motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

THE arrangements of the Corporation of Dewsbury for supplying electric light are nearly complete. The new lighting station is a substantial structure, consisting of engine-room, boiler-house and battery-room. It is situated on the site of the old gasworks in Bradford Road, and has been erected at a cost of a little over 3,500*l*. Mr. Mark Scott, of Earlsheaton, is the contractor. Two 100-kilo Watt machines and one 50-kilo Watt machine have been supplied by Messrs. Crompton, London, the dynamos being coupled direct to the engines. A local firm, Messrs. J. & J. Horsfield, have put in the boilers. The mains have been laid by Messrs. Siemens Bros. & Co., London, their contract amounting to 3,856*l*. The area in which the Board of Trade, by their provisional order, made it compulsory for the Corporation to lay mains comprises the market-place, Daisy Hill, Long Causeway, Church Street, Northgate, a portion of Bradford Road, and Wellington Road to the top of Nelson Street. The low-tension three-wire system is the system that has been adopted. Mr. W. H. Preece, now the chief electrical engineer to the Post Office, devised the scheme, which, partly under Mr. Preece's own superintendence and partly under the superintendence of Mr. A. K. Greener, A.I.E.E., has now almost been carried out. Mr. J. B. Mitchell, of Bradford, has been appointed manager of the new station. It is the intention of the Corporation to supply through meter at 6*d*. per unit, this being about as expensive to a consumer as using gas at 3*s*. per 1,000. A shopkeeper will be able to obtain the same illuminating power which he now gets from gas at practically the same price.

THE electric-light installation at Harrod's Stores has now been thoroughly overhauled and completed, and a large extension of arc and incandescent lamps has been made, the lighting of some eighty arc lamps and several hundreds of incandescent fittings having been most satisfactorily accomplished.

ases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

All the main cables are fitted throughout on the three-wire system, and are carried to all the departments from the new distributing board fixed in the basement near wine cellar. Near this point numbers of mitres cross and recross. Each circuit is carried through carefully, provision being made in many cases for further extensions should they be required. In the new toilet and manicure saloons some good specimens of hammered brass are to be seen finished in the Adams style, and designed specially to suit the character of the existing decorations, executed by Messrs. Raynes Smith & Co., of Finsbury Circus Buildings. In the photographic department a powerful exposure and printing lamp with adjustable reflecting-hood has been fixed, which is a novelty in arc lighting, a 50-ampere current being sent directly through the carbons without the intervention of the usual cumbrous regulating gear.

BUILDING AND BUILDERS.

THE lock-out in the building trade of Bolton and district, which has extended over many weeks, has just terminated, after a conference between the employers and the men. About 1,000 operatives were affected in the joinery, bricklaying, slating, plastering and plumbing trades. The dispute, which related to the introduction of stone-cutting machinery and other questions, has been ended by mutual concessions. The plumbers are still out, however, having declined the proposals offered.

THE extraordinary amount of house building which has been going on in all directions for some time past in Troon has made it desirable that additional street names should be found. Attempts to identify some of the localities by random titles conferred on them have, it is stated, recently been rather puzzling.

IT is proposed to build a new hotel in Bath on the site of the old Sydney College, at the end of Pulteney Street, adjoining the Sydney Gardens. The property, which includes the gardens, has been purchased by Mr. David Jones. The architect is Mr. John Whittingham, London, who designed the Grand Atlantic Hotel, at Weston-super-Mare.

THE Corporation of Sheffield are about to make their first venture as builders of artisans' dwellings. In carrying out the widening of Eyre Street, it is necessary to demolish 23 houses, most of them back-to-back dwellings. The Local Government Board made it a condition that the Corporation erect other

workmen's dwellings in place of those pulled down. The Corporation have accordingly offered contracts for the erection of seven dwellings.

AT the meeting of the Bradford School Board tenders were accepted for the erection of Byron Street School, amounting to 12,137*l.*, subject to the approval of the Education Department. The plans were for a higher boys and girls' school, giving accommodation for 420 girls and 420 boys, and there would also be accommodation in science and art rooms, chemical laboratory and lecture-hall for 374, making the total accommodation 1,214. The building would be in three storeys, the ground floor having four classrooms and two classes in the hall and a cookery classroom, the first floor comprising five classrooms and two classes in the assembly-hall, and the second floor containing two science and art classrooms, two art-rooms, a chemical laboratory and a lecture-hall seating 120. The rooms on the second floor for science and art would be used by both departments. The accommodation approved by the Education Department was 1,098, viz. 549 boys and 549 girls. The total cost would be 18,400*l.*, the total cost per head being 16*l.* 12*s.* 7*d.*, and the cost per head of the accommodation at ten square feet per child 9*l.* 17*s.* 9*d.*

TRADE NOTES.

THE Weybridge Schools, Weybridge, Surrey, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A NEW eight-day turret clock, striking the hours on the large bell, and showing the time upon two external dials painted and gilt, from the designs and plans of Lord Grimthorpe, has been erected in the tower of the parish church, South Kirkby, near Wakefield, the necessary work having been executed by Messrs. William Potts & Sons, clock manufacturers, of Leeds and Newcastle-on-Tyne.

THE warming of St. Agatha's Church, Portsmouth, an illustration of which appeared lately in *The Architect*, has been placed in the hands of Mr. W. J. Fox, of South Place, Finsbury, and a very complete system of thoroughly warming so large an area has been arranged. Also the warming of St. Michael's Church, Camden Road, N.W., and St. Mary's Church, Woolwich (both of which churches have been recently enlarged), has been

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 11 inches seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving.

"ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 8 parts. Standard Testing Sand, 230 lbs. per square inch: 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

carried out by him; also the new offices of Messrs. Nestle & Co., Cannon Street, E.C., will be heated by his apparatus.

THE No. 2 contract of the Pudsey sewerage scheme has been let to Mr. John Simpson, of Hunslet, for 3,100*l*.

IN connection with the Wilsden waterworks, Messrs. Stephen Greenwood & Son, of Wilsden, have got the order for digging and laying of pipes, which are to be supplied by Messrs. Chapham Bros., of Keighley; the hydrants, valves, &c., are to be made by Messrs. Blakeborough & Sons, of Brighouse.

VARIETIES.

ALREADY 700*l*. has been collected for the Infant Prince Fund for the Victoria Hospital for Children, Chelsea, to commemorate the birth of an heir to the English throne, of which a most fitting and generous contribution of 50*l*. has been made by the graduates, members and associates of the Children's Salon, the band of young gentlewomen who are working to endow beds in children's hospitals in connection with the *Gentlewoman* newspaper. Captain Blount, the secretary, will be glad to acknowledge further donations.

At the meeting of the Lord Provost's committee of the Edinburgh Town Council, Messrs. Cunningham, Blyth & Westland, engineers, submitted plans of the proposed new North Bridge, prepared in terms of instructions from the Corporation. The plans were approved and instructions given to advertise for offers for the work.

THE *Glasgow Herald* says:—All the ironworks in Coatbridge are now in full swing, or nearly so, having obtained supplies of coal at rates which enable them to carry on work. The blast furnaces are being prepared for restarting, and it is expected that in one or two cases the blast will be put on before the end of the week.

THE work of removing the mud accumulated in Boston Dock is suspended. During the present season the dredger has removed 27,840 tons at a cost of 724*l*.

AT the excursion meeting of the Durham and Northumberland Architectural Society the members visited Great Ayton and Newton in Cleveland, where interesting churches were examined. The most attractive place at Great Ayton was the old church, which was examined with special interest, the president of the Society, Rev. Dr. Greenwell, expressing pleasure at the fact that the old features had been retained whilst the

new church was being built. The architectural features were described very ably by Mr. C. C. Hodges. Newton Church was then visited. Here the Norman chancel and a rich Norman door and font came in for the largest measure of attention. At Guisborough the history of the church was given by Mr. Wm. Brown, and the architectural features were described by Mr. Hodges. The "Bruce Tomb" was also described by Mr. Brown.

THE Ayr Harbour Trustees have resolved to rebuild the wall on the south side of the harbour at a cost of 21,000*l*.

DEMOLITION OF A MILL CHIMNEY.

THE chimney of a corn mill in West Gore Street, Salford, which was recently destroyed by fire, has been taken down to make room for the new branch of the Lancashire and Yorkshire Railway from Windsor Bridge to the Salford Docks of the Ship Canal. The work was carried out under the direction of Mr. J. Smith, of Rochdale, the "Lancashire Steeple Jack." The chimney was 35 yards high. The method adopted was to remove a course of bricks at the foot, each brick as it was knocked out being replaced by a wood block. When the bricks had been withdrawn in such number that the chimney was almost entirely resting on its new support, the space below was filled with the materials for a fire. A light was applied, and in about a quarter of an hour the supports were burned through and the chimney leaned forward and fell in a mass. In the line of its fall was a gable wall of the old corn mill, which was brought down at the same time. The incident passed without mishap.

SEWAGE DISPOSAL.

AT the meeting of the Sanitary Congress in Liverpool, Dr. H. Littlejohn, of Sheffield, gave an address on the "Present position of the sewage disposal problem." He took it for granted that all sanitarians were agreed that the only method of sewage disposal consistent with modern civilisation and sanitary science was that by water carriage. It was now admitted after prolonged trial that all conservancy methods were practically failures, both as regarded results economically and as regarded what was of more importance—freedom from nuisance. The question of the effective treatment of sewage had assumed an importance that it was impossible to over-

estimate. Though a considerable number of sanitary authorities had attempted to deal with the question it must not be taken as representing that they had solved the problem of effectively dealing with their sewage.

Dr. George Reid, the medical officer of health, Staffordshire County Council, also read a paper on "Slop closets." He said that before coming to a conclusion as to whether slop closets might be accepted as substitutes for ordinary water-closets, their merits and demerits must be considered, and what was very important, the local conditions must be taken into account. Recent experiments in Stafford had shown that the answer to the question was not so simple as it would seem, and the arguments in favour of the slop closet system, based upon the diminution in the volume of sewage to be pumped and disposed of, appeared to be far outweighed by the complications which the system gave rise to in the purification process.

CROWDING HOUSES ON LAND.

AN address on the overcrowding of houses on land was given by Dr. Longstaff, of the London County Council, in Liverpool. Liverpool, he said, still was the densest city in Great Britain. A special form of overcrowding of buildings from which Liverpool and other northern towns suffered greatly was that known as "back-to-back" construction. Blocks of cottages built on this plan faced upon two streets without any intervening space, so that except at the ends each tenement had but one external wall. In addition to other grave disadvantages of the kind commonly called "sanitary," it was impossible to properly ventilate such houses, as a through current of air was out of the question, and it was difficult to light them adequately. The principle underlying the model by-laws of the Local Government Board, which had been adopted with variations by most of the large towns, were explained and contrasted with the "limiting angle," adopted in Liverpool and London. It was shown that the latter method interfered less with the discretion of the building owner. He thought that in some respects our sanitary law had already passed the just limit of interference with the liberty of the individual, but the evils of streets badly laid out and of houses improperly crowded upon the land were great, and withal so enduring, they could only be dealt with by an external controlling authority. He was convinced that this was one case in which legislature was bound to interfere and to confer ample powers upon the municipality.

JAPAN AND ENGLISH MACHINERY.

IN his last report from Yokohama, Consul Frazer says:—As a rule, the importation of manufactures of metals, machinery and the like, maintains its ground. Rails of English make have been in request, the demand coming now for the purposes of private lines. The bulk of the rails imported into the country were 60 lbs. and 50 lbs. sections, but there is a demand also for 20 lbs. and lighter sections for tram-work. Considerable orders for bridge-work for private lines have also been placed, as well as for locomotives. The former have mostly gone to England, whereas American locomotives seem to find favour with many of the Japanese railway engineers. The import of electric plant is also largely in the hands of Americans. Much of this is now, however, made in Japan. Projects for electric tramways are spoken of for some of the larger cities, but nothing has yet been actually done in this direction. Under the heading of machinery, that for spinning purposes again shows a considerable amount, owing to the continued development of the spinning industry in this country. In the report on the trade of Yokohama for the year 1890 it was remarked that the continental packing of machinery and plant was more careful than the English. The same is still true, and wonder is sometimes expressed that English makers should spend so much time in the making of machinery well, while they apparently take little pains to secure that it arrives at its destination in good condition. It may also be remarked that English makers do not pay so much attention to the get-up of specifications and drawings as their competitors do. They are apt too, apparently, to think that as data sent from here are often not very complete, business is not likely to result, and hence do not take much trouble to obtain it. The reason for more details not being supplied is that the Japanese engineers are not in most cases able to specify in detail what is wanted, and leave many details to the maker. At the same time, where suggestions are made by the former in the way of what they think improvements, it would be for the interest of the English maker that he paid as much attention to such suggestions as the continental maker appears to do. At the risk of repeating what has also been alluded to in a former report, it should be again noted here that it is not sufficient for makers at home to have travellers or experts visiting this country with a view to business. It is not to be expected that such can meet with much success, unless where working in concert with firms which have connections on the spot and local knowledge.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

THE MERSEY DOCKS.

THE report of the treasurer of the Mersey Dock Estate for July 1 last states that the total receipts of the Trust were 1,385,759 $\frac{1}{2}$ l., and the total expenditure 1,150,321 $\frac{1}{2}$ l. The rates on shipping and merchandise have brought in 1,071,224 $\frac{1}{2}$ l. The expenditure for interest upon the bond debt is 622,842 $\frac{1}{2}$ l., for the engineers' department 209,638 $\frac{1}{2}$ l., for the harbour masters' department 39,972 $\frac{1}{2}$ l. Of the credit balance of 235,437 $\frac{1}{2}$ l., the sum of 100,000 $\frac{1}{2}$ l. is paid to the sinking fund and the remainder variously appropriated. The treasurer also gives his usual returns of the shipping traffic of the port: 21,170 vessels paid rates amounting to 470,677 $\frac{1}{2}$ l., and the tonnage of these vessels was 9,960,902. There is an increase over the previous year both in tonnage and rates paid, but the returns are slightly behind 1891, the record year.

MOSAICS.*

THE art of inlaying small cubes of glass, stone, marble, plaster, enamel, shells, precious stones and wood has existed from the most remote times. "The pavement of red and blue and white and black marble," or "porphyry and marble and alabaster and stone of blue colour," mentioned in the Book of Esther as adorning the court of the garden of King Ahasuerus, was without doubt a pavement of mosaic work. The earliest but least interesting existing specimens of this work are those used in the ornamentation of ivory thrones and jewellery, and there are several beautiful examples of ivory carvings from Nineveh and Egypt in the British Museum, consisting principally of the figures of deities formed of the lotus and papyrus plants, which are enriched by the inlaying of lapis lazuli and other pseudo gems. Mosaics of a similar kind, but more ambitious, have been found in Lower Egypt, and these are the caps of columns, wall tiles, &c., of white limestone or earthenware, which are embellished by brilliantly coloured bits of glass or enamelled earthenware being let in. By the third century B.C. the art had made considerable strides, for we are informed that, in the great ship of Hiero, the tyrant of Syracuse, mosaic floors were laid down and were composed of coloured marbles, representing the whole of the Iliad, a work which occupied 300

workmen an entire year to execute. Another kind of mosaic was known to the Egyptians of this period, and was made entirely of glass; there is a fine specimen of this in the British Museum, representing the sacred hawk, every feather being accurately produced in the requisite shades of colour. The ingenious mode of manufacture is well worth describing. Numbers of long sticks of various coloured glass were arranged in such a way that their ends produced the figure of the hawk; other sticks of blue glass were placed all round, so as to form the ground. The bundle of sticks when looked at endwise now revealed the figure of the hawk with a blue background, but of a size much larger than that ultimately intended. To reduce the figures to the required size the bundle was heated till the sticks melted together, and thus softened, was then drawn out to a greatly diminished thickness, and it seems wonderful that the relative positions of the sticks of glass forming the design were not altered, and that the hawk was not transformed into a prize turkey. A slice of the rod was then cut off and its face polished, and revealed a thing of beauty and great delicacy, an additional advantage being that many slices of hawk could be cut from the same bundle. While on the subject of mosaic manufacture it would be well to describe what is known by surmise, and the descriptions given to us by Vitruvius of the process of making the Roman tessellated mosaics, traces of which are to be found wherever the Romans settled. The earth was first carefully rammed down to a firm and even surface; on this was laid a thick bed of stones, rubbish and lime from 6 to 9 inches deep, and above this another layer, 4 to 6 inches thick, of one part of lime to three of pounded brick, mixed with water; on this, while still soft, the pattern could be sketched out with a wooden or metal point, and the tesserae, or small bits of marble, stuck into it, with their smoothest side uppermost. Lime, pounded white marble and water were then mixed to the consistency of cream, forming a hard-setting cement called marmoratum. This white fluid was poured over the marble surface, and well brushed into all the interstices between the tesserae. When the concrete and cement were both set, the surface of the pavement was rubbed down and polished.

When the mosaic art was carried from Greece to Rome, it was known as *Opus Musivum* and was greatly in vogue, being applied to floors, walls and ceilings. Pompeii is wonderfully rich in examples; there is, indeed, scarcely a house which has been excavated that is without them. One of the most famous and interesting of these examples is known as *The Doves of*

* A paper by Mr. R. Bentley Young, read before the South Australian Society of Arts.

the Capitol, found in the Villa of Hadrian, and which appears to be a copy or imitation of the Cantharus and Doves, the work of Sosus, over which Pliny goes into such raptures. The mosaic masterpiece of Sosus, though, is what is called *The Unswept House*, and depicts the remains of a banquet on the floor. In *The House of the Faun*, a minutely executed scene of *The Battle of Issus* was found, and is considered the chief classical historical picture in existence. It represents the moment of Alexander's victorious charge against the cavalry of Darius. There are many specimens of Roman mosaic work in England, the most beautiful of which are the pavements in the chapel of Edward the Confessor in Westminster Abbey, and in front of the tomb of Becket at Canterbury Cathedral. Some of the pavements found in Gloucestershire and Lincolnshire are very interesting; upon one is shown a monogram that may be seen in the catacombs, and a representation also of the Ichthys, or sacred fish, may be seen upon another—workmanship which is supposed to be older than the time of Constantine. In the nineteenth chapter of St. John, verse 13, the following is written:—"When Pilate, therefore, heard that saying, he brought Jesus forth and sat down in the place that is called the pavement," but in the Hebrew, Gabbatha, the Greek term being lithostratum, or disposition of stones, and consisting of cubes of marble and enamel intermixed. This, therefore, was evidently a tessellated pavement, and it has been remarked as a singular thing that Doré in his great picture of *Christ Leaving the Pretorium* should have entirely overlooked this fact, and lost the opportunity of rendering the only feature which is actually given as a realisable detail. Some of the finest early Roman marble mosaics are to be found in Algeria and Tunis, excellent marble abounding in the vicinity, an advantage which was not available to the Romans in Britain, where marble has rarely been used by them in pavement work. In the third century mosaics began to be employed in the service of Christianity, and became a beautiful vehicle of religious expression in the churches of the world, where it still holds powerful sway. Of these early mosaics that of St. Pudentiana is considered one of the finest. It dates from the fourth century, and is far in advance of contemporary work. M. Vitel, the French critic, says that in its composition appear "quite new treasures, chaste expressions, a flower of virtue, a moral grandeur, with which the most beautiful works of antiquity are but imperfectly imbued."

The Mediæval mosaics used to decorate walls and vaults, made of coloured glass cubes, marbles and glass in small

pieces, and made opaque by the addition of oxide of tin, are without doubt Byzantine in origin. The mosaics of St. Sophia and St. Saviour in Constantinople are of the sixth century, being identical in style with those of Italy of the same date. Tesserae of gold and silver were at this time much in use, and were made by spreading the metal leaf over a glass slab, and upon this slab a skin of colourless glass was fused, and the slab was then broken into cubes. *Opus Alexandrinum*, so-called from having been first introduced in the reign of Alexandrinus Severus, was made partly of small marble tesserae forming the main lines of the pattern, and partly of large pieces used. The finest example of this work is found at St. Mark's, Venice (twelfth century). The mosaics of the fifth and sixth centuries, as seen at Ravenna (a veritable city of mosaics) are considered quite equal to any of the twelfth-century work, at which time a mosaic revival set in, reaching a culmination of exceeding splendour in the fifteenth century. Some examples of this revival may be cited. One of the finest is without doubt the cathedral of Monreale, near Palermo, begun in 1174. Fergusson, in his "History of Architecture," says that "the architectural features in the buildings of which this cathedral is the type were subordinate in the eyes of their builders to the mosaic decorations, which cover every part of the interior, and are in fact the glory and pride of the edifice by which alone it is enabled to take rank amongst the finest of Mediæval churches. All the principal personages of the Bible are represented in the stiff but grand style of Greek art; they are separated and intermixed with arabesques and ornaments in colour and gold, making up a decoration unrivalled in its class by anything (except perhaps St. Mark's) the Middle Ages have produced. No specimen of opaque painting of its class on this side of the Alps can compete with it in any way." Fergusson also has much to say in praise of the beautiful mosaic pavements which adorn the Roman basilicas. "These," he says, "were always original, being designed for the buildings in which they are used and following the arrangement of the architecture surrounding them. The patterns, too, are always elegant and appropriate to the purpose, and, as the colours are in like manner generally harmoniously blended, they form not only a most appropriate but most beautiful basement to the architecture. A still more important feature was the great mosaic picture that always adorned the semi-dome of the apse, representing most generally the Saviour seated in glory surrounded by saints."

(To be concluded.)

TOWN REFUSE.

PAPERS were read before the members assembled at the Sanitary Congress in Liverpool on methods of dealing with town refuse.

Mr. John A. Brodie, some time chief assistant to the Liverpool city engineer, read a paper in which he gave a description of recent improvements in refuse destructors, particularly alluding to the method of charging the Liverpool destructor. He also explained the principles of the destructor now being constructed for the Corporation of Cambridge, the special object sought to be attained being the generation of steam for sewage pumping purposes.

Mr. James Deas, manager of the Warrington destructor, gave a paper on the "Disposal of Town and Other Refuse by Burning." He pointed out that for many years past the question of dealing with the refuse in towns had occupied the attention of local and municipal authorities, and various schemes had been suggested to remedy the evil. All sanitary reformers and engineers were now agreed that the most economical system and the safest from a public health point of view was to destroy the refuse by fire. The necessary conditions for a perfect destructor were (1) to destroy rapidly all unscreened refuse without committing any offence or possible nuisance; (2) to reduce the refuse dealt with to the least possible amount of clinker, and (3) to deal with the refuse and by-products with the greatest economy and efficiency. In the new destructor at Warrington the above conditions were complied with and successfully carried out. The total height from

ground level to charging platform was only 8 feet 9 inches, half the height of the inclined roadway to other destructors. The refuse was tipped direct into the hopper, and fell down on to the inclined path where it was partially burnt and dried, and all the gases were absolutely destroyed by the radiation of the intense heat of the furnaces, by being drawn through and over the hottest part of the fire, entering into ignition and complete combustion in a chamber where a temperature of over 2,000 degrees was maintained, before finally passing away through the boiler. This intense heat and form of furnace disposed of the necessity of a secondary fire, dignified by the name of cremator. Mr. Carter Bell, the county analyst, had tested the escaping gases several times, and his report stated that he drew various samples of gases from the chamber at the foot of the chimney-shaft, and in no case did he find the slightest trace of sulphuretted hydrogen or mephitic vapours. There was no trace of carbonic acid. The daily amount of refuse burnt in the Warrington destructor equalled twenty tons per twenty-four hours, which far exceeded all other forms in use. Objection had been raised by persons viewing this destructor as to the high temperature attained and the possibility of the brickwork being rapidly burned away. An experience of thirteen months' continuous working did not confirm that opinion, as no repairs had been necessary and no expense incurred. During the process of burning fine particles of dust fixed themselves on the crown of the arch and exposed portions of the furnace in stalactitic form, thus protecting the brickwork from the intense heat. The furnace had been at work since August 1893, and was as good now as it was on the day it was erected. From daily experience he found he could evaporate one pound of water from one pound of unscreened town's refuse, and the value of steam, by burning town's refuse, would form a very important factor for corporations in the near future.

Mr. H. Royle, C.E., described "The Acme Refuse Destructor." The inventors of the Acme destructor, in their design, kept in view the necessity of complete combustion of all the organic matter, and not the merely putting it out of sight and smell. The refuse was tipped into the large receptacle or hopper, from whence it fell through the opening on to the sloping bars, which were set at about an angle of 45 deg., and as the organic or combustible portion burnt out, the residual material gradually fell to the lowest position, whence it was removed by the attendant at the front and side using a long shanked shovel. As quickly as it was removed a further quantity fell down the incline plane formed by the bars, which

63 FORE STREET, LONDON, E.C. Branches at Manchester, Leeds, Bristol and Glasgow.

in its turn was followed by a fresh portion from the hopper. Thus the feeding-in of the material was almost as gradual as though rocking-bars were employed. Although designed as a destructor only, it was as capable as any other of being adapted to the generating of steam when the material to be burned contained enough heat-producing material; it equally permitted the use of rocking-bars, as also the use of a steam or other blower being applied.

THE JOHANNESBURG HOSPITAL.

THE building forming the Johannesburg Hospital, of which Mr. Arthur H. Reid is architect, stand upon a site measuring 1,080 feet by 620 feet, and is surrounded on all sides by roadways. It is situated on the side of the hill to the north of the town, which it overlooks, and is approached by roadways with iron gates and brick piers to the two entrances. The main block of the building may roughly be divided into four sections, viz. the centre block, east wing, west wing and administration blocks. The centre block is devoted to private patients, surgical wards, convalescents' and waiting-rooms, office accommodation, storage and operating-room. The west wing is exclusively devoted to male patients; the east wing, on the ground floor, is also used by male patients, and on the first floor by females and children. The administration block is situated at the rear of the centre block, and comprises the kitchen with servants' quarters, and stores and matron's and nurses' quarters. Ascending a flight of cut stone steps at the front entrance, and entering the vestibule, which is in the centre tower, the visitor passes into the central corridor, off which the visitors' waiting-room is on the right and the dispensary on the left. The secretary's office adjoins the waiting-room, and before one enters the main corridor, which runs at right angles to the central corridor, there are three private wards to the right and left, each 10 feet by 9 feet by 12 feet 9 inches high, and also a private patients' day-room 12 feet by 9 feet. Continuing along the central corridor, one comes to two surgical wards, at the end of one of which is a passage leading to the operating-room. The main corridor, which is 150 feet by 8 feet by 14 feet 3 inches high, connects the east and west wings to the central block. Taking the east wing first, the visitor arrives at the lift-well, where patients are moved from floor to floor in their beds, with the attendants accompanying them.

At the end of the corridor there are general male wards to the right and left, that to the left being for ten beds and that to the right for six beds. Each of these wards has its own nurses' or ante-room, fitted with washing-trough and supplied with hot and cold water. At the end of the corridor also there is on the right-hand side a bathroom and lavatory. The west wing has almost precisely similar accommodation throughout. A new ward to accommodate twenty-five patients, with auxiliary kitchens and all necessary appurtenances, is now in course of construction in the rear of the administration block. In the latter there are kitchen, scullery, pantry, boiler-house and various other apartments, including a fumigating-room and a padded-room for violent patients. This portion of the building is now being enlarged, the extensions comprising napery-room, dispensary and dispenser's quarters. On the first floor the accommodation in the central block, as well as in the east and west wings, is generally the same as on the ground floor. The front portion of the central block contains six private wards, a private patient's day-room and a nurses' room in the tower, which is also fitted up as a dark room for ophthalmic examinations. The ordinary bed accommodation provided in the main block totals 101 beds, though on an emergency by curtailing the convalescents' day-room accommodation and overcrowding the other wards, 120 beds could easily be provided. For nurses the number of beds provided is thirty-one, including three beds in the infirmary. The new free ward will accommodate 25 patients. The native wards now have 65 beds, and the temporary hospital 26 more for sundry classes. The front portion of the central block is carried to a second floor, which is filled with cupboards and shelving for the storage of linen, bedding and appliances, as well as the clothing and belongings of living and deceased patients. The central tower is carried to a third storey, in which provision is made for a 6-foot dial clock case, which can be lighted up inside and would be seen from all parts of the town. The tower is 64 feet high from the ground to the top of the dome railing, which is surmounted by a flagstaff.

On account of the exposed position of the buildings and their altitude above sea-level, and the very efficient system of natural ventilation adopted, the following cubic air-space is allowed, and is acknowledged by the medical officers as being perfectly sufficient, even when the atmosphere is without disturbance and the temperature at its highest:—Large general wards, 1,050 cubic feet per bed; surgical wards, 980 cubic feet per bed; private paying patients' wards, 1,080 to 1,530 cubic feet per bed; women's wards (temporary), 1,200 cubic feet per

bed; children's wards (temporary), 750 cubic feet per bed; native wards, 440 to 550 cubic feet per bed. The floor-space allotted to each bed is as follows:—Large general wards, 70 and 80 superficial feet per bed; surgical wards, ditto; private paying patients' wards, 90 to 120 superficial feet per bed; women's wards (temporary), no fixed space; children's wards (temporary), 80 superficial feet per bed; native wards, 40 superficial feet per bed. The sanitation is necessarily of a primitive description at present, on account of there being no underground drainage. Kitchen, laundry and house slops are run into tanks, which are emptied daily.

After mature deliberation the board, in carrying out a new drainage scheme for the hospital, decided to adopt the open gutter system, with Macfarlane's glass enamelled iron pipes only where the drains cross the roads or are in close proximity to inhabited quarters. The open drains or gutters will be constructed of cement concrete, plastered to a smooth surface inside with cement and tarred. To prevent accidents and to avoid chokage by the admission of earth or other matter from the ground surface, the drains will be protected by timber covers from end to end, in lengths of 15 feet each, fitted with lifting rings for ready removal for daily cleansing. To prevent surface flood water from entering the drains, they are kept above the natural surface of the ground, and banked up on each side. Where pipe drains are necessary, they will be of enamelled cast-iron, with concrete inspection and cleansing chambers every 50 feet. At the head of each branch drain an automatic flushing tank will be provided, which will cause a flush with the waste water itself instead of using clean water for the purpose. If necessary, these tanks can be charged with disinfectants. All grease will be intercepted by grease traps at the outlets of the scullery and other sinks, thus preventing chokage or other trouble from that source, while "ripples" or corrugations will be formed to the bottoms and sides of the grease traps. By this means any grease or fat that might, either through heating or overcharging of the grease traps, pass through them, would, by exposure to the cold air, naturally solidify and be retained by the "ripples" or corrugations on the surface of the open drains. These sections of the drains will of course require regular cleansing with such hot alkaline agents as experience may show to be most suitable. The waste water from the laundry will be clarified and disinfected by passing first through a scum trap, which will intercept all soapuds and solids, and then through a precipitating and disinfecting pit, both of which will be so

constructed as to be easily cleaned daily. The drainage liquids are divided into two classes, each having its own independent conduit, namely, the foul or possibly infectious liquids, and that which is clean or innocuous, such as lavatory or bathroom waste. The former is discharged into cemented tanks and then led by gravitation through pipes to a standpipe, whence it is discharged direct into a sanitary cart and removed. The latter is discharged into similar tanks and led by pipes to hydrants in the lower levels of the ground, where it is used for watering the trees, &c. Both these tanks are in duplicate, for the purpose of cleansing or repairing without interfering with the service, and at the same time, being built at different levels, the lower one will act as a reserve of any overflow that might take place, should the higher one not be emptied at any time. The heads of all branch drains will be fitted with automatic disinfectors, properly gauged to continuously discharge a solution of permanganate of potash or other disinfectant into the drains.

The heating of the hospital is effected by open register grates and coal fuel. The whole establishment is lighted by paraffin lamps. Water is supplied by the waterworks company into elevated tanks above the roof level. The rain-water, however, is conserved in underground brick cisterns, into which it is led by brick drains. Each rain-water down-pipe has a 40-gallon rivetted iron tank at its foot, with a separator, the overflow from which, being clean, is conducted into the underground cisterns. These separators intercept locusts and other contaminating agents. Hot water is laid on all over the building, to baths, lavatories and nurses' room, being supplied from a 6 horse-power independent vertical boiler. The architectural style adopted in the construction of the hospital buildings is Renaissance of a somewhat severe type. The principal contractors have been Messrs. Mudge & Dunstan and Messrs. H. & H. Beckett. Mr. James Toogood has acted as clerk of works throughout.

At Warwick a discovery has been made by some workmen while making alterations at the back of a house in Jury Street, of a subterranean passage. They were able to proceed for some distance, but were at last stopped by a solid block of masonry. The passage is 6 feet in height and 4 feet wide, and in some places appears hewn out of the solid rock. It is supposed to be one of those mentioned by Dugdale as being in connection with the Castle and is believed to have led to the old church.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above are labelled, either inside or outside with our Trade Mark—"The Anchor."

ANTWERP EXHIBITION.

Architects, Engineers, Builders and Subscribers to "The Architect," intending to visit the Exhibition, are invited to call on or write to our Correspondent in Brussels, who will be glad to give any information to secure them a pleasant stay in Belgium.

DOCTORS' COMMONS.

EXTENSIVE demolitions have been begun in St. Paul's Churchyard at the south-west angle of the cathedral, and the old house and archway, long known as the entrance to Doctors' Commons, will shortly be cleared away. This pile of buildings, which has been refaced in the past and present centuries, is the place where Sir Christopher Wren had his offices, and in the room over the archway the plans for St. Paul's Cathedral were designed and perfected. Messrs. Pawsons & Leaf's are enlarging their warehouse premises, having obtained a lease from the Ecclesiastical Commissioners, and intend to cover the whole ground in front of the deanery. The Post Office Savings Bank is about to be extended from Knight-bridge Street to Carter Lane, opposite the choir school of St. Paul's. Here, again, the owners and tenants are under notice to vacate their premises. The Vicar-General's office for marriage licenses will move on the 29th inst. to 3 Creed Lane, Ludgate Hill.

The history of Doctors' Commons is ancient and interesting. There was a college for the Professors of Civil and Canon Law in London as early as the eighth century. In February 1568, Dr. Henry Harvey, Dean of the Arches and Master of Trinity Hall (which was founded at Cambridge, chiefly for the study of the Civil and Common Law), procured from the Dean and Chapter of London a lease of Mountjoy House, in the parish of St. Benet's, Paul's Wharfe, for the accommodation of the Society. Other Courts being held here, the whole place received the appellation of Doctors' Commons. The original college was destroyed in the great fire in 1666. After the fire, until 1672, the Society held its Courts at Exeter House, in the Strand. In the year 1768 a royal charter was obtained by virtue of which the then members of the Society and their successors were incorporated under the name and title of "The College of Doctors of Law exercent in the Ecclesiastical and Admiralty Courts." The college consisted of a president (the Dean of Arches for the time being) and of those Doctors of Law who, "having regularly taken the degree in either of the Universities of Oxford and Cambridge and having been admitted advocates in pursuance of the rescript of the Archbishop of Canterbury, shall have been elected Fellows" in the manner prescribed by the charter. The judges of the Archiepiscopal Courts were always selected from this college. By Act of Parliament, 20 & 21 Vict. c. 77, sections 116 and 117, the college was empowered to

sell its real and personal estate and to surrender its charter to Her Majesty, and it was enacted that on such surrender the college should be dissolved and the property thereof belong to the then existing members as tenants in common for their own use and benefit. In pursuance of this enactment the college was dissolved and the whole of the buildings sold by public auction on November 28, 1862. The site of the college and the residences and gardens belonging to the twelve resident doctors have since been appropriated to the formation of Queen Victoria Street and the erection of the Civil Service Stores, the Post Office Savings Bank and the chief office of the British and Foreign Bible Society. The wills and documents from the old Prerogative Court, which adjoined the college, and has since been pulled down, were transferred to the Court of Probate Registry at Somerset House in 1874. The Ecclesiastical Courts are now open to all the members of the Bar of England generally, and the 39 & 40th Vict. c. 66, permits solicitors of the Supreme Court to appear as proctors in the Provincial Courts of Canterbury and York.

HOUSING OF THE POOR.

A CONFERENCE of municipal and county engineers was held in connection with the Sanitary Congress in Liverpool. Mr. A. M. Fowler, who presided, delivered the opening address, and referred to several questions which called for the serious consideration of all those whose duty it was to endeavour to improve the health and the sanitary condition of the people. These questions included:—(1) The housing of the poor and working classes; the improvement in the condition of the dwellings, and the development of facilities to meet this end; (2) the improvement in the surfaces of the streets and ground in towns; and (3) the water supply for domestic use. It would, he said, be futile to endeavour to mature a condition of hygiene in the absence of satisfactory dwellings being provided for the poor, because it was here where the initial stage of contagious diseases invariably germinated. The question of housing the poor had been discussed from time to time during the past eighteen years, and hundreds of thousands of pounds had been expended on what had been called the improved system of building blocks of artisans' dwellings, and he was free to admit that it was an improvement on the former state of

things ; but, on the other hand, it was (in his opinion) as yet far from satisfactory. He had come to the conclusion that the back-to-back house self contained (as so extensively constructed at Leeds on the modern plan) was the best class of house for the working man. Next in importance to the construction and maintenance of cottage houses was the construction and cleanliness of the streets in large towns, and the quick removal of filth therefrom. The enormous saving could not be estimated by the construction of public roads in large towns with improved (almost noiseless) hard wood pavement or the improved asphalt, and by the constant removal of filth from the streets. The noise of traffic, by the adoption of wood pavement, was reduced to a minimum, and the deadening of sound to the occupants of buildings adjoining streets was conducive to the health of the nervous system, and enabled business to be transacted with ease and comfort. The preservation of horse-flesh, not only by reducing the friction in vehicles passing over the surface, but by the wear and tear of the vehicles, was enormous, and resulted in the vehicular traffic being considerably reduced. The accumulation of dust and dirt was also reduced. There was no doubt, as many medical men throughout the country had shown, that the floating particles in the atmosphere aggravated bronchitis and created lung diseases, as in manufactories by the dust of coal, sand, steel, cotton and hemp ; also from stone quarries where the workmen suffered by inhalation. But the suspended matters in the air in large towns, chiefly consisted of dust from refuse and organic matter, and imperfectly consumed particles of coal. He would refer to another sanitary matter, and that was the importance of a supply of soft water, especially to large towns. The benefits and economy arising therefrom in its various applications and use were enormous when the digits of account were added up and the total ascertained. The importance of securing a soft water for domestic purposes and for generating steam in boilers for motive power could not be over-estimated. The hardship of having to use hard water enforced upon the working classes was one of the most serious matters for correction for the attainment of health and cleanliness, inasmuch as it was evident to any observant mind that wherever excessively hard water was used, washing clothes were practically abandoned and dark clothes were substituted to save the trouble and expense of washing. The next important topic before the public was the purification of sewage before the effluent therefrom was allowed to discharge into rivers and streams. A great deal has been said of late—volumes of papers

read and lectures given on this subject—and at least twenty schemes were now before the public which showed that this object of purification could be attained. But when the cost of the works was analysed it was found next to impossible to carry most of them into practical use. The filtration of sewage to gain this end was looked to with some prospect of success, both through land where it was in many cases effectually done, and through artificial filter-beds ; in the latter iron in its various forms was brought to bear in solving the question. It was very dangerous to deviate from mother earth and abandon nature's purifier for artificial contrivances.

SANITARY PROGRESS.

ON Monday the annual Congress of the Sanitary Institute began in Liverpool. Sir Francis S. Powell, M.P., delivered the inaugural address. He said it was impossible to consider the subject of sanitary progress in the country without a sense of satisfaction, almost of triumph. The difficulties which hindered their progress diminished both in area and in gravity. Improvement in public health had justified both the cost and the labour expended. The Local Government Board had during the last twenty years sanctioned a capital expenditure, chiefly for sanitary purposes, of 53,021,334*l.* in urban and of 3,923,270*l.* in rural districts, while during the same period local Acts had authorised a further expenditure of 67,335,956*l.* Vital statistics abundantly proved the wisdom of such expenditure.

In speaking of general sanitation, the President said that administration rather than legislation now demanded the energies of the sanitary reformer. Domestic buildings in London might still be erected to the height of 80 feet, exclusive of two storeys in the roof, power being unfortunately reserved to the London County Council to sanction the construction of buildings even of more gigantic proportions. Air and light could not perform their life-giving functions at the base of those structures, still less within courts enclosed in them. It was not an exaggeration to say that the dwellings of our nation were being built in the course of the present half-century. The erection of new houses and the destruction of old were everywhere seen. They were erected under by-laws for the most part wise, and were maintained under regulations conducive to health. Errors of judgment hindered progress. Doubts were already expressed as to the system of huge con-

structions under the name of artisans' or model dwellings. The Mansion House Council, no mean authority, described certain blocks of artisans' dwellings as a "difficulty which wants promptly dealing with." "These," said their committee, "have been erected without any regard to sufficient air and light around them." They added that "these places are haunts of dirt and immorality." In the cases of private dwellings and of model lodgings, the tenant had his duty to perform as well as the owner. Public authorities were helpless without the sanction of public opinion. Such opinion must be created by active agencies, by suasion, by personal visits. No paid official could wait and persuade as could the kindly visitor. We must place confidence in our schools. It was difficult to believe that children who passed long and pleasant hours in cleanly and well-ventilated schools would rest content with dirty and unwholesome dwellings. The factory and workshop not less than the dwelling were comprehended within the wide range of the sanitary province. The present Home Secretary administered with sympathy and full appreciation the statute passed by his predecessor. The employment, within wise limits, of female inspectors, especially as regards workrooms, would reveal many secrets and effect long-called-for reforms. Increased security against accident, improved appliances for ventilation and general conditions creating greater physical comfort during the hours of labour would increasingly improve the health of the artisan population. Health alone for the moment occupied their thoughts, but it could not be forgotten that the moral tone of the factory and workroom hands and their mode of life exerted influences upon health not less important than the conditions within the control of public authorities and of Parliament. It would not suffice to guard the workshop and the dwellings from injurious influences within. The health of the people could not be sound if the air were polluted. We must doubtless make sacrifices in order to conduct industrial processes. But the magnitude of those sacrifices must be diminished. We knew the common saying in reply to a complaint of nuisance arising from smoke, that "Smoke brings money." There was a new and better adage, "Smoke brings cost." The working classes might discover that the smoke which rendered cleanliness difficult and the brightness of a home impossible imposed upon them labour which was unnecessary and cost which might well be spared. The President proceeded to refer to the legislation dealing with processes dangerous to the health of workers, and went on to speak of river pollution. We could not hope by one effort in one generation to restore our streams to their

original purity. But we could do much. The Rivers Pollution Bill would be introduced in the next session. The Bill had been twice submitted to the House of Commons. He was not without hopes that Government would grant an inquiry by a select committee. Those who felt difficulties would thus have every opportunity of stating them, and Parliament would be better prepared to decide as to the concessions which ought to be made to the exigencies of manufacturers and the susceptibilities of some municipal authorities. The Government of the day might then undertake a task which appeared to exceed the opportunities of non-official members. The exhaustive report of the Royal Commission on the Metropolitan Water Supply claimed the fullest consideration. Let us wait no longer for new laws, but put into effect the laws already on the statute book. There might be some return of population to rural districts, but a vast proportion of our inhabitants must continue and probably in growing proportions to dwell in urban districts. We must, therefore, with all zeal bestow energy and knowledge on the improvement of our towns. To the attractions already dominant let there be added those of health and even of ornament. Towns had at their command efficient drainage, ample supply of water, prompt removal of refuse. They were acquiring by slow but sure degrees arrangements of their dwellings favourable to health. To the spacious parks must be added the open spaces protected from all cause of annoyance. Lord Meath's Public Garden Association could now claim between one and two thousand acres of open spaces as the result of their efforts within the Metropolis. What had been done in London must be possible elsewhere. He himself was full of hopes for the future. "Those hopes," he concluded, "will be in a large measure fulfilled if the advance of the next half century is equal to that made in the fifty years now counted among the past. I see on every side reasons for encouragement, none for holding back. There is everywhere fuller knowledge, riper experience, more sympathy from public opinion. Let us all press on in our great task, each a thoughtful and active worker in his own province. Our reward will be seen in every home which we purify, every family which we strengthen, every population which we elevate. None can foresee what struggles are at hand, what rude encounters are near, what severe competitions are to be met. It is our endeavour and our duty to prepare our nation for every trial, to give strength to bear hardship, vigour to conduct the contest, endurance to persist until the victory is gained."

VENTILATION OF THEATRES.

In a letter to the *Manchester Guardian*, Mr. Codling, engineer, says it is unfortunately true that nearly all our halls and theatres are so deficient in ventilation that it is impossible for them to be full for more than half an hour without the air becoming so highly charged with carbonic acid and organic effluvia from the lungs and the skin of the occupants that not only is headache, sore throat or weariness the inevitable consequence, but there is the further and greater danger of inhaling the seeds of disease from the micro-organisms that infest these polluted atmospheres. Air of standard purity contains four vols of carbonic acid per 10,000, and when the air of a room has more than seven vols of carbonic acid produced by respiration it is no longer fit for breathing, and no system of ventilation can be considered satisfactory which allows carbonic acid to approach this point. From numerous analyses that have been made of the composition of the air of theatres, halls and schools during occupation, it has been found that the carbonic acid often rises to over 35 vols per 10,000, or 28 vols per 10,000 beyond the limit at which air will continuously support life. Living in such a poisonous atmosphere as this, even for a short time, cannot fail to affect the vital functions and render us more susceptible to disease, and when inhaled for longer periods, as by children in ill-ventilated schools, numerous cases of lung disease are sure to be the result. The ventilating arrangements of many of our public buildings show plainly, from the very nature of the designs, that the authors were ignorant of the elementary principles that underlie the science. To insure that each person in a crowded building shall have a sufficient supply of air at a proper temperature, free from impurities and without draughts, requires the exercise of a great deal of skill and experience. It is impossible to obtain it by the method at present largely in vogue of providing inlets in the walls and outlet cowl at the top of the building, often without any regard to size and position, and trusting to the wind to supply the power for extraction, or natural ventilation, as it is called. Until it is recognised more than it is at present that this class of building can only be efficiently ventilated by mechanical means, i.e. by drawing or driving into the building air of sufficient quantity and at least as pure as the external atmosphere, it will be futile to expect any improvement in the atmosphere of these buildings during occupation.

A NEW ELECTRIC RAILWAY.

A WORK of unusual interest, says the *Standard*, has been begun on the Surrey side of the Thames, close to the west side of Blackfriars Bridge. There, emerging from the water, will be seen an extensive platform, similar to but longer than the one for several years in use at Swan Pier for the excavation of the tunnel under the Thames for the City and Southwark Electric Railway. That line was originally intended to be worked by cable, but the new line from Waterloo to the City is from the outset designed for electric traction. It has unbroken continuity of more than a mile and a half from the great terminus of the London and South-Western line—a length sufficient for the keenest competition with the omnibuses. It will deliver its passenger freights at the end of Queen Victoria Street, in the very heart of the City, and will thus make Waterloo Station more convenient than the London Bridge and Cannon Street Stations of the South-Eastern Company, and doubtless add value to the suburban regions of the South-Western Railway. The new line passes by an easy curve diagonally under the river, and this curve gives a starting impetus to the trains in either direction, which, combined with the electrical motive power, will enable a speed of twenty-two miles an hour to be attained. The locomotive trains of the Metropolitan Underground Railway do not work at more than eight miles. But these are not all the benefits which have been contemplated for the City passenger traffic. Great relief to the street traffic will be afforded by a most serviceable underground circular subway surrounding the great central underground station, with its booking-offices, lifts and passenger platforms. This will occupy all the space between the ends of Queen Victoria Street, the Poultry, Prince's and Threadneedle Streets, Cornhill and Lombard Street. Some time ago a central electric railway was projected to run from Shepherd's Bush, along and under Oxford Street, with a central station in front of the Mansion House, as a part of that scheme. For this, powers have been obtained, and the plans approved by the City of London Corporation. So that the further interest attaches to the new electric line of being the first to enter into the longest and most important underground central station of the busiest locality in the world. The circular subway will have its floor at 10 feet below the present surface, and will be itself 8 feet in height, there being 2 feet of roof above it. Access will be had to it by stairs at the angle-corner of Queen Victoria Street and

the Poultry; at the angle of the Union Bank with Prince's Street; at the opposite corner of the Bank of England; in front of the Royal Exchange; at the angle of Cornhill with Lombard Street; at the side of the Mansion House in Walbrook; and at the angle of Walbrook with Queen Victoria Street. By it passengers can pass to or from any of those points without being exposed to the dangers of crossing the busy traffic or the surface above ground. These stairs have been planned in the slackways which vehicular traffic always leaves near the corners of the streets, so that they will not interfere with the horse-roads nor the footways. Under the passenger subway there will be a special subway for gas and water-pipes and electrical mains, so that there shall be, after its execution, no need for breaking up the surface paving.

At the Waterloo end the arrangements are planned with special regard to the convenience of passengers arriving or departing by the trains of the South-Western Company. The Electric Railway will enter at the arches on which the terminus is built, and at right angles to the whole of the numerous arrival departure and suburban platforms, from each of which descent by stairs will give access to the platforms of the new railway. The electric line is being carried out by a special company, which is, however, fostered by the South-Western, and several of the directors of that company have seats on its board. The works are being carried on under the joint engineering control of Mr. Galbraith, of the South-Western, and Mr. Greathead, who designed and constructed the City of London and Southwark electric line. The principle of construction and the mode of execution will be the same as those so successfully carried out in that instance. The tunnels will be each formed of an iron ring or culvert, formed of segments bolted together by their flanges planed to smooth surfaces. Through small holes in the iron culvert cement will be blown, to form a skin on the exterior, whilst the inside will be concreted to form a smooth surface level with the inwardly projecting flanges of the segments. The diameter of the iron culvert will be 12 feet, increased to 12 feet 9 inches at the stations. The contract for the two parallel tunnels has been let to Messrs. Mowlem & Co., of Westminster, and the caissons which will form the means of access to the borings have already been sunk under the staging at Blackfriars Bridge to a depth of 50 feet. As soon as the depth of the floors of the intended tunnels (65 feet) is attained, the four protecting shields and the mechanical excavators will be lowered into position, and the driving of the tunnels will be carried on simultaneously in both directions. The method of

working will be the same as in the former instance of the City and Southwark. As soon as the first ring of the culvert is put together a shield is put in the front. Through a door in it the face of the heading is accessible to the miner, who picks out the central core of the rock. The shield has a projecting edge all round its periphery, which, as the shield is pushed forward by the hydraulic presses, cuts a circular hole sufficiently large for putting the iron segments together to the proper dimensions of the culvert. Wedges being inserted in the rock face between the periphery of the shield and the central core cavity, the intervening rock is broken into fragments and falls down between the shield and the face of the heading, being shovelled up thence and sent away to the rear in skips. Thus the progress will be made ring by ring, one at a time, each ring advancing the tunnel by 2 feet. The geological formation through which the tunnels will be excavated will be London clay for the entire distance, except at Stamford Street, where there will be a deposit of gravel to be pierced containing large volumes of water, which will be met by overpowering air-pressure, as at Stockwell on the Southwark line.

The particular method of working the line by electricity has not yet been determined, nor has the site of the generating station been fixed upon, but it will probably be at the Waterloo terminus. The success of the Overhead Electrical Railway at Liverpool must certainly give rise to a consideration of the important differences in working by electric locomotives as on the Southwark line, or by electric motors attached to the passenger carriages themselves. There will also have to be reviewed the question of short trains and short intervals, or long trains and long intervals, although the nature of the traffic arriving by railway main line trains and by suburban trains will be an essential factor in its determination on the Waterloo and City new line. In Liverpool two carriages are run as a train on the frequent system, these carriages each containing sixty passengers. A very important electrical consideration is, however, fundamentally involved, namely, the stress and loss of current in the starting of the heavy electric locomotives.

ADMIRALTY BUILDINGS.

EARLY in the new year, the *Daily News* says, it is hoped that the first block of the new Admiralty buildings overlooking the Horse Guards' Parade and St. James's Park will be ready for occupation. This new edifice is not to supersede the old

Admiralty; it will be an extension of it. There are many who will think it unfortunate that it should be so. Ripley's building is not one that we can any of us be proud of, and Mr. John Taylor, London Surveyor of the Office of Works, told a Parliamentary committee in 1887 that it was then 135 years old, and would probably have to be pulled down and rebuilt at the end of another seventy-five years. It had at that time been decided to build an entirely new Admiralty and War Office, and Messrs. Leeming & Leeming, architects, of Halifax, had designed a very imposing and beautiful building which would have accommodated the headquarters of both services. But it was estimated to cost 700,000*l.*, in addition to 490,000*l.* which had already been spent in the purchase of a site. This was thought to be rather too large an order, and the matter was referred to the select committee already mentioned. This committee reported their opinion that, after all, the scheme should be abandoned. "We are satisfied," they said, "that by making additions to the present Admiralty all the requirements of that department may be suitably provided for; that this work, including some repairs and improvements to the existing building can be done at a moderate cost, and may be completed within two or at most three years, and that a very large reduction of expense would thus be secured." It was an excellent motive for a change of plans, a motive that all taxpayers can fully appreciate. But the effect of this report was to deprive Messrs. Leeming's plans of much that was really very fine, to leave the old Admiralty still to hide its ugly front from behind the stone screen—set up in front of it purposely to conceal its clumsy proportions—and, most unfortunate of all, to involve in all probability before the business is done with an outlay even greater than that which so staggered the Treasury ten or twelve years ago. When this is done, the War Office will still have to be provided for, and the present idea seems to be to erect a fine new building for that branch of the service on a very valuable site facing the Horse Guards and separated from the Admiralty only by the width of Whitehall.

However, the change in plans either for good or bad was decided upon, and the block now approaching completion is the partial embodiment of the alternative scheme finally adopted. It is a handsome piece of building, and well worthy of its fine position. It is of red brick and Portland stone, and when completed will have cost about 150,000*l.*, of which no less than 23,000*l.* has been spent on the foundations. This heavy expenditure has been rendered necessary by the nature of the soil, an interesting light upon which has just recently been

thrown by the discovery at the depth of 20 feet of what is believed to be an old river pier, showing that at one time the Thames extended over what is now the Parade Ground, and that boats no doubt formerly came up here. It is very well known that the present Admiralty has no better foundation than oak planking and sleepers laid in oozy mud, so that with some truth it has been said that the Admiralty floats as well as its ships. We have less reliance on British oak than we used to have, and the subsidence that has taken place in the old building has shown the desirability for a more trustworthy foundation for the new one. The contractors have got right down to the London clay, involving excavations at some points of about 30 feet, and upon the London clay they have built up in concrete what is in fact a huge tank 24 feet deep, 106 feet wide and 300 feet long, with a mass of concrete 6 feet deep for its bottom. In this tank the new building has been placed, thus giving it a splendid foundation, and most effectually precluding all risk of dampness as well as subsidence. From its concrete bottom the new edifice rises six storeys high, and the roof seems to be as noteworthy as the base. It is constructed of steel encased in fireproof material. The whole building, it need hardly be said, is fireproof and in its internal arrangement shows something of a new departure in Government establishments, many of which, including some of the more modern ones, are by no means up to the latest standard as regards considerations of health of those engaged in them and are very indifferently lighted, especially the corridors giving access to the various rooms within them. In this building special attention has been paid to both these points. In the centre of it is a court open from the basement to the sky, and round this the corridors run. The doors of the rooms—of which there are 120 for occupation and 50 to serve as official repositories—open from these corridors, the windows all looking outward all round the block. Across the middle of the central court tiers of lavatories are built so as to be quite out of the main building and entirely surrounded by the open air. The rooms will all be heated by open fireplaces, supplemented in the case of the principal ones on the first floor—to be occupied by the chief officers of the service—by warmed fresh air, distributed by steam-driven fans. In summer the air instead of being warmed, will be driven over a refrigerating apparatus.

This looks a little luxurious, but the building throughout, though thoroughly good and substantial, will be found to present little that can be described as extravagant. On the whole the internal fittings are plain. There is no sort of show

London Office:—68 QUEEN STREET, CHEAPSIDE, E.C.

apartment anywhere about it. There are on the first floor a number of reception-rooms, and on this same floor and on the same side of the building, that looking across the park, are the rooms allotted to the Naval Lords. The First Lord's apartment overlooks the Horse Guards' Parade. These will be nice rooms, but nothing very imposing. Indeed, a reasonable economy appears to have prevailed throughout. It was at one time determined to take one of the best rooms on the park side as the Admiralty board-room, instead of the one in which the affairs of the British Navy have been discussed and controlled ever since the Admiralty was built. This old board-room is a fine and interesting chamber, and it has direct association with all the most momentous and thrilling events of our modern naval history. A very natural sentiment appears to have prevailed against any change, and it now seems to be settled that the Admiralty Board shall meet round the old table in the old room.

The new block stands back to back with the existing old one, but with a considerable space between them. When the full design has been carried out, this new building will form the west side of a quadrangle, and the old building the east side. Along the north side of this quadrangle another new block will join the other two, and for this part of the work plans are now being got out. The connection between the existing Admiralty and the new block at their southern ends will be different. There will be a handsome elevated dome at each end of this southern façade when all is complete, and between these two domes—one of which is now rapidly approaching completion—a columnar stone screen will connect the new with the old building. This screen will also serve as a covered footway between the ground floor of the buildings, and beneath it a subway will afford internal communication. A knowledge of these features of the completed plans will lend significance to some of the work now in progress otherwise unintelligible. That this new Government establishment has long been sorely needed can hardly be doubted by anybody who has had occasion to penetrate the interior mazes of the present Admiralty. The original building has for many a long day been wholly inadequate to the service, and at least thirty neighbouring houses as well as a chapel of ease have been one by one annexed and incorporated. Doorways have been knocked between them, and bridges have spanned intervening streets and passages, and such a bewildering warren as has thus grown together can be found hardly anywhere else in London. A sum of 300,000*l.* will probably have been spent before all is

done, and not improbably a good deal more than that; but that it was a work really necessary can hardly be questioned, and the chances are that by the time it has been completed we shall begin to discover unanswerable reasons for making a clean sweep of the ugly old front in Whitehall and all that pertains to it, and bringing forward into the main thoroughfare a handsome and coherent whole, worthy of the British navy and the fine position the establishment occupies.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

17208. François Hubert Lenders, for "An improved composition forming a substitute for stone, marble, plaster and the like."

17221. Josef Rueben, for "Improvements in or relating to fireproof ceilings."

17238. John James Spear, for "An apparatus to stop the noise of the inrush of water to water-closet tanks."

17282. Joseph Hamblet, for "Improvements in kilns for burning bricks, tiles, drain-pipes and for other purposes."

17317. John James Hanbury, for "Improvements in pipe-couplings."

17366. Craven, Dunnill & Co., Limited, and Thomas Pitt, for "Improvements in apparatus for the manufacture of tiles."

17403. Brodie Cochran, for "Improvements in or relating to the manufacture of bricks."

17408. Joseph Victor Hibbert and Arnett Hibbert, for "A new process of protecting plaster-casts, and rendering them washable."

17467. James Fagan, for "Improvements in flushing cisterns for water-closets."

17571. Daniel Dimond White, for "Improvements in mechanism for ships' water-closets."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

WINTER, WARMTH & COMFORT

HEATING AND VENTILATING APPARATUS.

GRUNDY'S SPECIALTY. PURE WARM AIR
UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR, as Supplied to

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouse Factories, Workhouses, &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.
Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.
Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus enabled to spend my winters in England instead of on a foreign shore,—Yours very truly,
JOHN TYNDALL.

Dr. GRIEVES says:—

Buckhurst Manor, Wadhurst.
I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. should not like my house warmed with any other method, for I like plenty of ventilation and do not approve of stagnant air.

Book of Testimonials gladly forwarded gratis on application to

JOHN GRUNDY,
30 DUNCAN TERRACE, CITY ROAD, LONDON
And TYLDESLEY, NEAR MANCHESTER.
Telegrams:—"JOHN GRUNDY, LONDON."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

SOME large new stables are just being completed for Sir Peter Walker, Bart, at Osmaston Manor, Derbyshire, and the large clock has been erected by John Smith & Sons, Midland Clock Works, Derby.

As a tribute to the memory of the late Rev. George London, the teachers and scholars of St. George's Schools, Altrincham, have placed a very handsome font in the church, designed and executed by Messrs. J. & H. Patteson, Oxford Street, Manchester. The font is of octagonal form, in rich Derbyshire alabaster. The massive basin is supported by a column of rich red Devonshire marble with carved capitals, and the whole rests upon an octagonal base. On four sides are carved the sacred monogram "I.H.S.," the sacred cross, three fishes representing the Trinity, and the Pascal Lamb. Round the base of the font in gold letters is the following inscription:—"Erected in loving memory of the Rev. George London, for thirty-three years vicar of this parish, by the teachers and scholars of St. George's Schools, 1894." This, together with the beautiful window placed in the north aisle, forms a very appropriate memorial of the late vicar.

THE extensions to the Royal Hospital, Richmond, Surrey, are now nearing completion. A new children's ward, called the "Princess May Ward," has been added, which is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester. The architect is Mr. Frank J. Brewer, of Richmond.

ELECTRICAL.

THE committee of the Hertford Corporation have decided to make application to the Local Government Board for a loan of 6,000*l.* for carrying out the electric-lighting scheme—700*l.* for the land and 5,300*l.* for the necessary plant, &c.

THE electric-lighting committee of St. Helen's Corporation have had under consideration the question of electric lighting in the borough, and the town clerk was instructed to arrange terms with Mr. Robert Hammond, London, for a report as to the adoption of a scheme for the supply of electricity. Mr. Hammond agreed to make a report for the fee of 50 guineas, such fee, in the event of his being engaged as engineer for the carrying out of the scheme, to merge into his commission on the cost of the work.

IT is reported that there is now every prospect of the scheme for the construction of an electric railway to the summit of Snowdon being carried out in a short time. The services of Mr. Duncan Fox, engineer, have been commissioned, and his plans will probably be framed on the lines of those adopted for similar railways on the Continent.

COUNCILLOR MEADE-KING, a member of the Liverpool Corporation, having suggested that the electric light should be substituted for gas at St. George's Hall and the Municipal Buildings, the finance sub-committee considered the matter, and have recommended that, in view of the great improvements constantly being made in the electric light, it was not desirable to incur any large expenditure on the electric light at present.

VARIETIES.

AN exhibition is announced to be opened in November at the Royal Aquarium, Westminster, under the direction of an honorary committee, consisting of Joseph T. Clarke, G. R. Halkett, Ernest Hart, M.D., A. S. Hartrick, F. G. Prange, L. Ravenhill, Gleeson White, Victor Champier and F. G. Dumas. Examples of the following English artists will be exhibited:—H. Herkomer, R.A., Walter Crane, Dudley Hardy, Aubrey Beardsley, "Pal," Cleaver, Maltby, Steer, the Brothers Beggarstaff, Halls, Brangwyn, Mortimer Menpes and Furness, &c., whilst the French School will be represented by Cheret, Grasset, Lautrec, Steinlen, Willette, Grevin, Forain, Boutet de Monvel, Guillaume, Metivet, Van Beers and Bonnard. An illustrated catalogue in colours is in preparation, edited by Edward Bella.

WE have much pleasure in drawing attention to the new private post-cards, with "Sketches of Familiar London," by Mr. W. Hanson. The blocks have been produced, and the cards are printed and published by Messrs. Beechings, Limited, 174 Strand, W.C. This is the first attempt in England to introduce the illustrated post-card so usual on the Continent. The engravings submitted to us show the Houses of Parliament, Westminster Abbey, St. Paul's Cathedral, the new Tower Bridge over the Thames and the Tower of London. The price per dozen is only 4*s. 6d.*

AT Hereford a Local Government inquiry has been held in reference to an application by the Town Council for powers to borrow 3,800*l.* for improving the waterworks, and 300*l.* for work in connection with gas mains.

ELECTRIC LIGHTING

16, GEORGE STREET, WESTMINSTER, LONDON.

PROVIDENCE WORKS, MILLWALL.

COMPLETE EXPORT PLANTS

PUBLIC BUILDINGS, THEATRES, ETC.

ELECTRIC PUMPING, WINDING & TRACTION WORK.

AT the meeting of the Perth Dean of Guild Court, Bailie Kyd drew attention to the responsibility which was laid on the magistrates presiding at the Dean of Guild Courts by the new Police Act, and also to the number of plans which were brought before them got up in a rough sort of way, and not properly made out, which caused many adjournments to be made and continual annoyance before they were put right. He suggested that people wishing alterations made or new dwellings erected should get professional men to make out their plans, instead of the crude ideas of joiners and blacksmiths.

THE fine printing works of Alderman Cooke, in Hunslet Leeds, have been destroyed by fire. The damage altogether is estimated at 130,000*l*. This is partly covered by insurance.

THE large stores of the Somerset Trading Company at West Bay, Bridport, have also been destroyed by fire. The flames spread to adjacent premises, and before they could be checked the post-office and several houses and stores were gutted.

THE directors of the Longton Theatre Company have decided to proceed with the re-erection of the Queen's Theatre, which was destroyed by fire last week, and steps will be taken to push on with the work as speedily as possible.

AT the meeting of the Spalding Waterworks Company, it was announced that a new bore-well had been successfully sunk at Bourne. The bore was driven a depth of 134 feet, and would yield a supply of 2,592,000 gallons of water a day, at a pressure of 10 lbs. to the square inch. The water is of first-class quality, and it is proposed by the board to lay new mains from Spalding to Bourne in order to make the supply available. It was stated that this was the largest yield of water of any bore-well in England.

THE Neath Corporation have acquired possession of the Neath Waterworks at a cost of 46,000*l*.

COLONEL DUCAT, R.E., has held an inquiry at Brighton on behalf of the Local Government Board in reference to the application for power to borrow 14,900*l*. for the erection of a refuse destructor and cement stores. There was no opposition.

A FIRE-STATION is to be established at the riverside, Battersea, by the County Council. A building is to be erected for the accommodation of the staff near the southern end of the bridge at a cost of about 6,000*l*.

IT was announced from Antwerp that Great Britain, including colonies, was represented in the Exhibition by 271

exhibitors, who had gained 21 grand prizes, 42 diplomas of honour, 105 gold, 79 silver, and 46 bronze medals.

A FOSSIL tree has been discovered in a clay and shale pit at Sparth Bottoms, Rochdale. It is a fine specimen of sigillaria, 7 feet in height and 6 feet in girth at the base. The clay pit has often yielded smaller fossils.

SIR GEORGE BRUCE, C.E., the arbitrator, has decided upon 7*½**d*. as the price per 1,000 gallons to be paid to Cheltenham by Tewkesbury for the supply of water.

AWARDS AT THE HEALTH EXHIBITION.

AMONG the awards given at the exhibition in connection with the meeting of the Sanitary Congress, held in Liverpool, are the following:—Messrs. Doulton & Co., of Lambeth—the only medal for connecting pottery to lead—for their "Metallo-Keramic" joint, which we noticed in our columns some time since. The award fully confirms the favourable view we then expressed as to its merits; and the Albion Clay Company, Burton-on-Trent.

Medals.—Blackman Ventilating Company, London, electric, steam and water ventilating fans; Crossley Brothers, Limited, Manchester, small high-speed gas engine; B. R. Isaac, Liverpool, Newman's Hose Company; George Jennings, London, century syphonic closet; Peace & Norquay, Manchester, improved folding partition.

Certificates.—Billington Bros., Liverpool, for hospital beds. William G. Black, Edinburgh, for Aitken's apparatus for ascertaining the number of dust particles present in the atmosphere. Thos. Bradford & Co., Salford, for vowel Y washing and wringing machine. "Perfection washdown closet." Eagle Range and Foundry Company, Birmingham, "Eagle" grate. J. Gibbs & Son, Liverpool, improved ventilating inlet, with large removable outside grating. B. R. Isaac, Liverpool, Albion safety lamp; Morris instantaneous hose coupling. George Jennings, London, porcelain radial urinal, with stall and base in one piece. John Jones, Chelsea, London, smoke machine, and smoke bag stopper for drain testing. C. Kite & Co., London, lock valve ventilator. Shanks & Co., Barhead, Glasgow, Shanks's combination closet, with cistern immediately behind. J. Tylor & Sons, Limited, London, E.C., "Ariston" valve closet; "Column" closet and slop sink combined; and "Column" waste-preventing system (McCormack's patent).

OVER ONE HUNDRED PER CENT. PER ANNUM.

An investment bringing in such a return in these dull days is worthy of attention. In a letter to the YOST TYPEWRITER COMPANY, of date April 4 last, Messrs. PRICE BROS., of Dudley, wrote:—

"As to the objection of first cost, all we have to say is that we saved the cost of our Machine in less than twelve months."

T TRADE MARK

The Machine referred to as such an excellent investment was a YOST Typewriter. The YOST will yield you the same return that it has brought to Messrs. PRICE BROS.

NOTES ON NOVELTIES.

THE latest improvement in stall seats for theatres, music-halls, &c., consists of an ingenious automatic arrangement by which the seat closes on the occupant rising, and simply requires to be pulled down for further use. The illustration below gives a clear idea of its advantages. It will be seen that not only does this principle more effectually reserve a seat, but that it also occupies much less space, for there is only one iron standard to every seat, thus dispensing with half the usual quantity. The seats are also much easier of access, and one can walk comfortably in and out. The rows can go several inches closer

Nicholls & Co. have also patented an improvement in turn-up seats, to admit of the arms and backs of seats being turned up, the object in view being to occupy less space when grouped.

WE have received from Messrs. Christopher Baker & Sons, Limited, of 3 Broad Street Corner, Birmingham, an illustrated sheet of "Baker's curved and straight casement-stay and fastener combined." The advantages of the specialities are numerous, and only require a trial to prove their utility. Among other meritorious points they possess are protection against sudden gusts of wind straining the sash and endangering the glazing, the sash being firmly held in the centre when

together than in the ordinary way, a great consideration where economy of space is desired. The patentees and manufacturers of these automatic shut-up seats are Messrs. Nicholls & Co., of 45 (and 47 Endell Street, London, W.C., and we have no doubt that in a short time their patent will be generally adopted, and replace the old-fashioned seats now in use. Messrs. Nicholls & Co. have already placed them in the following:—Oxford Music Hall, Middlesex Music Hall, Bijou Theatre, Douglas, Isle of Man, &c. The same principle might be safely adopted in restaurants, billiard-rooms, &c. Messrs.

open, instead of, as usual, at the bottom; no movable screws or parts to get out of order, and strong section preventing their getting out of shape, which is a common fault with other stays, especially of the cheaper kinds; good appearance and half the usual fixing; less trouble to open and close the window; a great saving in cost, one article only to buy and fix; out of the way of young children; cheaper and more durable; sashes do not get banged to as in shutting with the bottom stays; will suit windows opening inwards or outwards; will suit all French casement windows. The straight pat-

tern does not require to be "handed," and it is especially suitable for top lights of bay windows, &c., where the sashes open outwards, hinged at the top or side. There is no danger of the window being imperfectly stayed, as the bar falls if not hooked properly, and they are out of the way of blinds.

"Simplex" Window-sash Fittings.—The "Simplex" Sash Company, of 86 Caroline Street, Birmingham, have introduced in the way of sash fittings what is very praiseworthy and yet simple. In the case of ordinary windows, the work is too often defective, though much good work is turned out here and there, but the best of work is liable to go wrong at times. The "Simplex" fittings practically get over such difficulties as arise from good work going wrong by reason of wear and tear. The price is lower than other methods of hanging sashes, and they can be hung in half the time. There is perfect simplicity of action. Both sides of window-panes can be cleaned inside the apartment, thereby obviating any risk of loss of life. The sashes can be stopped and fastened at any height desired, and the fastener is in easy reach on side of frame. No straining required to reach the sash-fastener, which is placed on meeting rails. It can be raised or lowered with the slightest pressure. The top sash may be lowered for ventilation by simply raising the bottom sash, the inside lining preventing bottom draught, and perfect ventilation is secured with the sashes securely locked. There are no cords to break or wear out, and no sash-weights or axle pulleys. No pulley-boxes or deep inside linings are required, only a $\frac{1}{2}$ -inch board for pulley style. There is also a saving in light and space in bay windows. Both sashes can be entirely removed from the frame in three minutes, for glazing or getting furniture in or out of room. No professional window-cleaner is required, as both sashes can be cleaned from the inside, and there is freedom from the objectionable rattle and draughts so prevalent with the present badly-secured frames. Existing sashes can be fitted at small cost.

A PUBLIC clock has been erected in the tower of the parish church of Wilsden, West Bradford, Yorkshire, by Messrs. Wm. Potts & Sons, clock manufacturers of Leeds and Newcastle-on-Tyne. They have fixed a large turret clock, striking the hours upon the fine bell in the tower, and showing the time upon four external dials. This busy manufacturing village, situated between the market towns of Bradford and Keighley, has hitherto not had a public clock.

OETZMANN'S PATENT
WRITING TABLE.

When closed forms an ordinary occasional table. Can be closed and locked with one action, and can only be opened with a key.

In solid walnut and lined with cloth, £2 18s. 6d.

BANK PREMISES, COVENTRY.

THE old banking premises belonging to the London and Midland Bank (and formerly the Coventry Union Banking Company), situated at the corner of High Street and Little Park Street, Coventry, have been pulled down, and new premises are now in the course of erection by Mr. Charles Haywood, jun., Coventry, from the designs of Mr. Frank Barlow Osborn, architect, Birmingham, for the London and Midland Bank, Coventry branch. The new buildings, which will be in the Elizabethan style of architecture, will comprise in addition to the banking premises a suite of let-off offices, situated on the ground-floor in Little Park Street, and a bank manager's residence on the first and upper floors. The banking-room, which will be 40 feet long and 34 feet wide, is arranged to accommodate twenty-six clerks, and will be approached from a vestibule at the corner of the two thoroughfares. The internal fittings will be constructed in polished walnut, and the bank counter, which will be 32 feet long, is arranged to accommodate five cashiers. The manager's office will face High Street and will be so arranged as to afford easy access to the vestibule, to the banking clerks and to the private speaking-box. The strong rooms, which are very spacious and secure, are situated in the basement, a hydraulic lift being provided, communicating with the banking-room over. The remaining portion of the basement will be appropriated to the use of store-rooms, lavatory, heating-chamber, &c., the whole being executed in a thoroughly fire and thief-resisting manner. The buildings, which will be executed in white Hollington stone, red bricks and roofed with tiles, is now being rapidly proceeded with, and it is expected will be completed by August next. The temporary offices of the bank are at 61 Hertford Street.

A GREAT display of chrysanthemums will be given on Wednesday, Thursday and Friday this month, October 10, 11 and 12, when the first show of the season of the National Chrysanthemum Society will take place at the Royal Aquarium, Westminster. Very fine novelties in Japanese chrysanthemums are promised, and prominent features of the miscellaneous class will be floral decorations formed of chrysanthemums. Exhibits of fruit, &c., of a high order of merit will add to the attractions of the show. There will be no extra charge. The variety entertainment on the great central stage will be strengthened by the renowned "Morritt," who promises a startling novel illusion, entitled "The Convict's Escape."

NEW CATALOGUES.

AN illustrated sanitary list has been issued by the General Iron Foundry Co., Limited, of 43 Upper Thames Street. The catalogue deals with lavatories, closets, baths, sinks, manhole doors, soil-pipes and connections, &c. Among twenty lavatory stands, many handsome designs (registered) are included. The effective appearance of these articles with the beautiful tilework and mirrors is well known, and the excellent fittings are all in character with the rest of the work. Lavatory ranges are shown, ornamental and others of plainer but useful kinds. Among the baths are the "Royal Sovereign" and the "Elm-bank," both of which are patented. In design they are quite out of the common. Notwithstanding the very ornamental character the prices seem very moderate. The decorated baths "Mikado" and "Flora" are prettily designed, one with Japanese work, while the other has a floral treatment. A large variety of closets are also illustrated, and among these is the "County Council" closet, a washdown with a special joint designed to meet requirements of sanitary authorities. We have only indicated a few of the appliances the catalogue refers to.

We have received a new illustrated list of the patents and specialties of Mr. James Gibbons, St. John's Works, Church Lane, Wolverhampton, lock manufacturer, general brass-founder and maker of all kinds of builders' ironmongery. Among the well-known Gibbons patents are the "anti-friction" mortise lock, "Dawkins's" museum bolt, espagnolette bolt, fanlight centres, improved lock for workmen's dwellings, improved patent "roller" axle pulley, mortise night latch, rim night latch, "roller" axle pulley, sash-lock, improved patent top and bottom sash-fasteners and lifts. An inspection of the illustrations will give a very good idea of the excellence of these specialties. Architects and builders will find it useful to have the catalogue by them for reference, as there are so many improvements in every direction that it is not possible to find space to describe them. The index of contents alone occupies

six columns. In addition a most valuable feature is the providing also of a numerical index, which is handy for those who consult the catalogue. Mr. Gibbons has long worked for all the well-known architects, and to call our readers' attention to his new catalogue is quite sufficient. The London offices and showrooms are at 9 Southampton Row, Holborn, W.C., under the management of Mr. T. Jones, the London representative.

PITCH PINE.

MESSRS. C. J. WADE & CO., timber merchants and importers, of 8 and 9 Great St. Helens, E.C., have received a large parcel of pitch pine, now piled away in the railway sheds, out of the ss. *Hazel Branch*, in the Surrey Commercial Docks, which has been deservedly recognised as one of the finest cargoes of this class of wood seen in the docks for some time past. On inspection board after board was found absolutely free from knots, shakes and all imperfections. Wood of this description should be more largely used for many reasons—its freedom from waste (there being no dead knots to cut out), and its beautiful grain, and as one of the cheapest and best woods for decorative purposes, suitable for church and school fittings, furniture work, &c. We are informed by the owners, Messrs. C. J. Wade & Co., that this parcel has been specially selected for them, kiln dried abroad, and carefully stacked under sheds.

PLUMBERS' COMPANY.

At the meeting of the Quarterly Court of the Plumbers' Company held on Saturday at Guildhall, the Master (Alderman Sir Stuart Knill, Bart.) took the oath as Master on his re-election to office for the ensuing year, and Sir Philip Magnus and Mr. Philip Wilkinson, F.R.I.B.A., were sworn into the offices of Warden and Renter Warden respectively.

A return was presented of the examinations held by the company under their Graded Syllabus of Practical and Theoretical Instruction for Plumbers, showing that the examinations for the current year had been held at twenty-four centres in the United Kingdom, and that the percentage of passes in the preliminary grade of the examinations was 30 per cent. as compared with 49 per cent. in the previous year, and the passes in the intermediate examinations were 30 per cent. as compared with 63 per cent. in 1893.

A report from Norwich was received announcing the forma-

THE FOREST FIRES.

THE *Vossische Zeitung* contains an article by Herr von Hesse-Wartegg, in which he describes a journey on the Canadian Pacific Railroad from Vancouver to Calgary during the late conflagration. He says:—

Two days and two nights we journeyed along the 700 miles of railway through the Rocky Mountains. But not in the usual conditions. We saw nothing of the beauty of the land, for immense clouds of smoke veiled the whole scene, filled the valleys, hung in the woods, and crept up the mountains. The air was hot and stifling, so that we could not open the windows. The sun looked like a red-hot ball, and when it set we could see the burning trees, sometimes far off, sometimes close by. Everything burned and smoked and crackled and sent up sparks; the flames leapt up from tree to tree, or caught the grass and bushes along the line and gnawed at the wooden sleepers; and we thought with alarm of the numerous wooden bridges over the deep cañons, many of which had been damaged by fire a few days before, and had been mended. Only one train per day ran, and what might not have happened since the train before us had passed? We rushed along between the big tree-torches, now and then stopped by one which had fallen over the track and had to be cut up and removed.

All these hundreds of miles nothing was to be seen but fire, smoke and broad fields of white ashes, out of which rose charred stumps and roots of trees. It was pitiful to see some forest giant, its leaves singed by the flames, then its boughs twisting, as if in pain, as the branches kindled one after the other. The railway journey through these parts was a race for life. The anxious passengers looked in alarm out of the windows; at any moment the train might leave the rails and the whole be burnt. The engine-driver and stoker had put on their great-coats, and poured water over each other; all the officials who could be spared were stationed along the line, and at every station the conductor eagerly read the telegrams to see whether the next stretch of road was passable. So it went on

for forty-eight anxious hours, and we could only breathe freely when we reached Calgary and the broad prairies. But worse was before us. During the next forty-eight hours we rushed through the prairies of Alberta, Assiniboia and Manitoba. At Winnipeg we read the first news of the fires in Northern Minnesota. Wisconsin and Michigan were in flames, and the forests along the northern shores of Lake Superior also. Though Winnipeg is about 200 miles distant from the great conflagration, we could even there feel the smoke, and it grew thicker as we approached the burning provinces. We could not see Rat Portage for the smoke, and at every station despatches told of still more and more misfortune. At last we began to meet the fugitives from the townships in the forests, all hurrying away from the scene of disaster. All these settlers, woodcutters by trade, stood at the different stations with the goods they had saved, waiting to enter our train. The more we advanced towards the east, the more frightful was the destruction. We saw the smoking ruins of the burned settlements among the charred stumps of the forest trees; innumerable horses, cattle and sheep with singed hair and wool, or wounds from burning, wandered about in the ashes, or stood on the relatively safe railroad, and had to be driven away to let us pass. At a small water-tank was waiting a group of Swedish settlers, two men, two women and four children. Their half-burnt dresses hung in rags, the hair and beards of the men were singed, they had wrapped their feet in wet rags and the faces and hands of the whole group were black and their eyes bloodshot—a terrible sight. Behind them stood a horse with singed mane and tail. The passengers did all they could to help these unfortunates. They had been surprised by the flames in their settlement, and had barely saved their lives by immediate flight. They feared that their neighbours had perished. Who knew whether a similar fate might not befall us if we proceeded? So we all decided to leave the train at Fort William and go by steamer on Lake Huron to Owensland, and from thence, *via* Toronto, to New York. Meanwhile we passed through burning forests and meadows, and at last, on the afternoon of the fifth day of our transcontinental journey, reached Fort William. But the voyage on the lake was not to be thought of. The immense sheet of water was so covered with smoke that the traffic had to be interrupted. We learnt from the newspapers that several steamers on Lake Superior and Lake Michigan had stranded on islands or banks, so that there was almost as much danger on the water as on the land. So we continued our way along the steep bank of Lake Superior,

seeing nothing of its shores or islands. We could scarcely breathe, and our eyes were painfully inflamed. On we went in the night, lighted up by the burning woods, and into the following day. Then we reached Montreal; the danger was past, and we could once more breathe freely, but even here and further on, past the Champlain and the Hudson, the atmosphere was still smoky. At New York no rain to speak of had fallen since June, and the woods, meadows and fields were dried up. The newspapers calculated that during the past week more than 60,000 square miles of country had been burned, a district as large as Württemberg, Baden, Saxony and Hesse put together. The extent of forest would exceed those of Thuringia, the Harz and the Odenwald. And the worst is that from 600 to 700 human beings have died the most terrible deaths.

DWELLINGS FOR THE POOR IN EDINBURGH.

THE sub-committee of the Lord Provost's committee of the Edinburgh Town Council dealing with the subject of dwellings for the poor have resolved to adhere to their former report recommending the erection of one and two-roomed dwellings in area D of the scheme under the Housing of the Working Classes Act, which embraces that portion of the old town lying between the High Street and Cowgate and between Blair Street and Borthwick's Close. They craved a remit to proceed with the erection of one block in the meantime, reporting the estimates before acceptance. Of this recommendation the Lord Provost's committee subsequently approved. The probable cost of this block is set down at about 8,500*l.*, roughly speaking, which is about a quarter of the total sum represented by the scheme to embrace the entire area. In all, it is proposed that there should be four blocks upon this area, to provide 245 houses, of which 106 will be one-roomed and 139 two-roomed. The block to be proceeded with at present will provide 24 houses of one room and 32 of two rooms.

The report of the sub-committee states that the improvement scheme under powers conferred by the Housing of the Working Classes Act, in course of being carried out, will abolish a number of the most insanitary and hopeless slums in Edinburgh. It will unhouse 2,712 persons, who must all be provided for properly. This scheme will make available a few convenient sites for suitable substituted houses for those insanitary hovels about to be demolished. To leave these sites open spaces would no doubt be very desirable. The difficulty

is that the Legislature has imposed the obligation upon the authorities to provide for those unhouse, and at the present time and until Corporations be empowered to take land for the purpose at reasonable value, the sub-committee consider that the authorities are shut up to the utilisation of these sites for rebuilding improved houses. The report examines the sources from which the cheapest houses are at present provided in the city, and finds that as regards the ordinary supply of new houses, as these have been passed through the Dean of Guild Court from week to week for a number of years past, no houses have been erected at rents lower than 10*l.* They consider therefore that Edinburgh suffers severely from the want of convenient sanitary and healthy housing for its poor and labouring classes. It is sometimes argued that this matter may be left to private enterprise, but the sub-committee are unable to detect any likelihood of private enterprise doing anything in the matter. Past experience proves that private enterprise will not be by any means forward in taking up this question. Private philanthropy has done perhaps more for Edinburgh than any other city in the kingdom, but no such agency, other than the Social Union, has as yet come to the front. The sub-committee is convinced after a careful consideration of all the circumstances of the case that the public authorities themselves must face this question in a practical way; and they further consider that, if properly conceived and carried out, with the aid of the facilities provided in favourable borrowing powers, such an undertaking may be financially self-supporting, besides resulting in social and moral benefit to the inhabitants of the districts in question, and therefore to the whole city. Next the report looks into the extent to which other cities are dealing with the housing of the poor, and then illustrates the financial aspect of the rebuilding of area D for the rehousing of those displaced by the Improvement Scheme. It recommends the rebuilding, in whole or in part, of this area—that is to say, the area of ground bounded on the north by High Street, on the south by Cowgate, on the east by Blair Street, and on the west by Borthwick's Close. This area is no doubt somewhat handicapped by the heavy fall of the ground, which adds to the cost of building, but it is meantime the most readily available site for the purpose. In order to realise the best results of light and airiness, convenience and cheerfulness, it is proposed to lay the ground out in four level cross terraces, rising from the Cowgate successively tier above tier. The best features of modern improved housing for the labouring classes will also be adopted, that is to say, the scheme will aim at

providing cheap and convenient houses for the poorest classes, and chiefly for those about to be displaced by the Improvement (Slum) Scheme—houses which will to a large extent combine the advantages of home privacy, the convenience and supervision of a model lodging-house, with all modern sanitary appliances, a recreation hall, a crèche, children's grounds and other advantages. The committee then considers the scheme with blocks of houses four storeys in height. These tenements (the report says) would require to be of substantial and suitable materials. The area of ground available for feuing purposes may be taken at 1·7 acres or thereby. In order to an equitable statement of the cost of the scheme, it is of course necessary to put a feuing value on the ground to be built on. The above area stated in superficial yards, exclusive of that required for accesses and closes, equals 8,190 superficial yards nearly. The sub-committee consider that a feu-duty of 6s. 8d. for each one-roomed house, and 10s. for each two-roomed house, is the maximum that could be imposed in the circumstances, giving in round figures a total feuing value of 3,150l. at thirty years' purchase, assuming the scheme to consist of one-roomed houses, 106; two-roomed houses, 139; total, 245. This will give a rate of density of population of about 520 persons or thereby per acre. Total cost of erecting four blocks complete, with caretaker's house, &c., 26,850l., to which add value of ground, 3,150l.; total outlay from which return is available, 30,000l. To yield a return of 3 per cent. on outlay of 30,000l., after allowing 33 per cent. for burdens, &c., the rents would be as follows:—106 houses of one apartment, at 1s. 6d. per week, 3l. 18s., equal to 413l. 8s.; 139 houses of two apartments, at 2s. 7d. per week, 6l. 14s. 4d., equal to 933l. 12s. 4d.; gross yearly rental, 1,347l. 0s. 4d.; deduct 33 per cent. for burdens, repairs, empties, &c., and contribution to sinking fund, say 447l. 0s. 4d.; net yearly rental, equal to 3 per cent. on outlay of 30,000l., equal to 900l. Assuming ordinary burdens, repairs, empties and superintendence amounted to 25 per cent. of the rental, the sum available for sinking fund is thus only 8 per cent., or 108l. per annum, which sum, earning interest at 3 per cent., would take 74 years to liquidate the capital sum of 30,000l. even if the rents were maintained at their original figure. But as the property would be considerably depreciated in value before the expiry of 74 years, and the cost of repairs considerably increased, it is unlikely that a yearly contribution of 108l. to a sinking fund could be maintained, so that it would probably require over 80 years to repay first cost. To repay original outlay within a more

reasonable time, it would be necessary to increase the rents of one-roomed houses from 1s. 9d. for the upper flats to 2s. 3d. for those on the first or second flats, and from 2s. 9d. to 3s. 3d. for houses of two apartments. The result of this increase in rental would be as follows:—106 houses of one apartment on an average of 2s. per week, 5l. 4s., equal to 551l. 4s.; 139 houses of one apartment on an average of 3s. per week, 7l. 16s., equal to 1,084l. 4s.—gross yearly rental, 1,635l. 8s. Burdens, empties, repairs, superintendence, 25 per cent., 408l. 17s.; interest on capital sum at 3 per cent., 900l.—equal to 1,308l. 17s.; sum available for sinking fund, 326l. 11s. This sum is rather less than 20 per cent. of the gross yearly rental, and with the same contribution yearly earning interest 3 per cent., would take forty-five years or thereby to reach the sum of 30,000l. With the scheme self-supporting, forty to fifty years is the shortest period at which the first cost could be repaid, unless the rents were to be still further increased. Should it be considered desirable to repay borrowed money in less time, then the city would require to contribute to the sinking fund. The outlay would only be temporary, as a considerable revenue would be derived from the properties when the debt was liquidated. The sub-committee desire further to say that, in view of the difficulty of maintaining in good sanitary condition the large number of properties scheduled under the Improvement Scheme, and of the unavoidable interference with the work of the public health committee in its regular oversight and maintenance of this class of property on account of said Improvement Scheme, it is extremely desirable and essential that this important question should be disposed of without delay. The sub-committee consider that they have presented a fair statement of the whole circumstances of this difficult subject, and while seeking to provide housing thoroughly well got up and conducive to the best interests of the health, comfort and morality of this section of the inhabitants of the city, they have also endeavoured to do what has not been done before, viz. to provide proper housing within the reach of the poorest of our fellow-citizens, and that without burdening the ratepayer with any share of the cost. They consider that in adopting such action as will tend to abolish "slum" life as known in the past, the city authority would be following a much more economical and wise policy than to allow "slum" conditions to increase year by year in spite of every possible effort at improvement, and be again compelled to adopt after a few years a revolutionary and costly improvement scheme.

PHOTOGRAPHY BY ARTIFICIAL LIGHT.

FOR photographic purposes sunlight is unreliable in the respect that when wanted it is often absent, and, moreover, it is considered now inferior to some forms of electric and other artificial lights. The proprietors of "The Photogram" have instituted a very useful and instructive exhibition at their offices in Farringdon Avenue, illustrative of the principal systems of photographing by artificial light, and they have chosen a most suitable period—whilst the exhibitions of the Royal Photographic Society and of the Photographic Salon are opened to the public, and photographers from all parts of the country are in town—and have arranged a series of demonstrations by experts while the exhibition is open during the present month. Amongst the most notable exhibits are the Houghton reflector arc lamp, the Adamson incandescent electric portrait lamp, the continuous magnesium portrait lamp, several forms of Pilsen arc lamps, Marion's magnesium light, Hart's magnesium light and Treble's incandescent gas-light. There are flash lamps in various forms for taking views in mines and other scenes of darkness. The careful design and perfect results attained by Mr. Adamson with his ring of small incandescent electric lights, so beautifully toned by their screen of white silk, are illustrated by a series of photographs which are marvellously soft in their unbroken gradations of tones and half-tones. Farringdon Avenue, a new thoroughfare, is on the site of the old Farringdon Market.

LAND FOR PUBLIC IMPROVEMENTS.

AT one of the meetings of the section of Sanitary Science and Preventive Medicine of the Sanitary Congress at Liverpool, Alderman Charles Burt, a member of the Surrey County Council, read a paper "On the Laws relating to the Acquisition of Land for Isolation Hospitals, Workmen's Dwellings and Public Improvements." He urged that an Act should be passed making the recent scattered improvements in the law of expropriation apply to all lands required for necessary and useful public purposes, and consolidating and amending the various Acts on the subject, making them into a clear and intelligible whole, and particularly that the new Act should embrace the following provisions, viz. :—(1) That orders of the Local Government Board and of the County Councils (subject to confirmation by the Local Government Board) for com-

pulsory acquisition of land required by local authorities for public purposes, made after due notice and public inquiry, should have the force of the law without an Act of Parliament. (2) That application for such orders may be made at any time on giving the prescribed notices, instead of being confined as at present to the months of September, October and November. (3) That the abolition of the additional price for compulsory sale should be extended to all the above cases, and the betterment clauses of the Housing Act of 1890, or some analogous provisions applied thereto where appropriate. (4) That the provisions of the Act of 1894 as to costs of counsel and witnesses should also be made of general application. 5. That the Local Government Board or the County Council, as the case may be, should be enabled to exclude the operation of section 92 of the Lands Clauses Act, 1845, in any cases where they think fit to do so. 6. That county courts should be authorised to deal with all compensation cases up to 500l., and that all the authorised tribunals be enabled to dispose of the claims of owners, lessees and occupiers in respect of the same property at one and the same time. He submitted that these amendments of the law were reasonable and just, and would tend to facilitate very largely the carrying out of public works and improvements by local authorities, and would reduce the cost and delay of acquiring land, and at the same time provide for full and fair compensation and protection to all parties interested in the property to be acquired. The mere existence of such an Act as he had suggested would do more than anything else to bring about agreements between public bodies and owners of land on reasonable terms, because land-owners would know that if such terms were not accepted the public authority could promptly and inexpensively bring compulsory powers into operation.

Mr. Washington Lyon said he was of opinion that the law should be altered as suggested. He thought there was no danger through an infectious hospital being placed in any locality if proper regulations were carried out inside the hospital.

Mr. J. Lemon, C.E., said that as an owner of property he should be very sorry to see any law pass by which a landowner would be robbed of that which he possessed; but what he maintained was that he held his property subject to the reasonable rights and wants of the community. He proposed, "That this section approves of the conclusions of Alderman Burt's paper, and recommends the council of the Sanitary Institute to take measures to secure the early adoption thereof."

"OPTIMUS" IMPROVED PATENT WIDE ANGLE CAMERA. EXTRA LONG FOCUS.

Dr. Brown seconded the motion, remarking that while property had its rights, it also had its duties. In Lancashire the large landowners realised their responsibilities in that direction. Alderman Burt, in replying, pointed out that parish councils had now wider powers than Liverpool or other large towns in regard to the subject under discussion. Of course that was absurd, and ought not to continue. His object in bringing the matter before the Congress was that it might go forward with its approval to the Local Government Board, or to members of the Government, in order that, if possible, next session a Bill might be passed on the lines he had suggested.

The resolution was then adopted.

THE RIVER AIRE AT LEEDS.

A PAPER was read by Mr. W. Horsfall, of the Camp Road Ironworks, on "The Cleansing of the River Aire," at the opening meeting of the session of the Leeds Association of Engineers. The question of cleansing the river Aire was not, he said, a question that really belonged to mechanical engineering; but mechanical engineers could possibly give an opinion on the subject as well as any other class of individuals, or at least they might do as much towards accomplishing the object as those that had the subject in hand. He had a pamphlet written by Mr. Malcolm McCulloch Paterson, M.I.C.E., in which he said that in the year 1866 a letter was sent to Sir Robert Rawlinson's River Commission, written in legible characters with a pen dipped in the water of the river Calder at Wakefield Bridge, and sent by a humorous correspondent as a silent but eloquent witness in testimony of the pollution of that river. Some parts of the river Aire and its tributaries were even worse. Mr. Horsfall explained by means of drawings how he proposed to deal with the subject of cleansing the river Aire, so far as Leeds was concerned. He proposed that the sludge from the bottom of the river should be collected and not be dependent upon floods, which might move some of the sludge out to sea, or at least out of this district, not forgetting that while their sludge was going out to sea they had a fresh supply coming down from Bradford and above to fill its place. It was perfectly fair that the districts below Leeds should complain at their having all the pollution of the river forced on them without a voice in the matter. When they remembered that there was only a fall of 79 feet from the boundary of

Leeds to the sea, they would see how the rule on friction in water-pipes would apply, and what the flow would consequently be. The people of Leeds had reason to complain at having the pollution of all the towns above it on this stream, and they might justly say that it was of no use their attempting to cleanse their portion if all the towns above did not cleanse theirs. This was where the rights of the West Riding County Council operated. He had not considered the question outside their own boundary. His survey was only to see if it was possible for them to cleanse their portion. If so, then it was possible for those higher up the stream to cleanse theirs; because the further they travelled towards the source of supply the less there was to cleanse. The Calverley Mill dam was above the city boundary, and it was a very favourable point to commence operations, or at least where the other towns delivered theirs. By again referring to the drawing, he showed how he proposed to collect the sludge at the point named. This he should propose was the duty of the nearest town or number of small towns like Rawdon, Apperley, Idle, Yeadon, Guiseley, &c. There were about ten dam heads or weirs in the city, where some attempt could be made to collect the sludge now lying in the river—the accumulation of years. And there were seven water wheels. For the purpose of explaining what might be done towards remedying the evil, he proposed to build at each of those weirs a trap or lock for the purpose of collecting the sludge as quickly as possible. And from the construction of those locks the bottom of the river would be reached. Nature had been good enough to provide a special point on this river where Leeds could be materially assisted in the final operation by using the tail-race of the Old Mill at Hunslet, now unoccupied. When making his survey he found that this property had been bought by the Aire & Calder Company; and, perhaps, they had in view some scheme of cleansing this part of the river. They were quite satisfied that the river must be cleansed. The important question was, How? They would like to have a few days' fishing on the banks of the river Aire in Leeds. But before they could arrive at that state of things they must have the accumulations of generations of pollution disposed of. So this accumulation of sludge must be gathered. And they might find that some kind of trap or lock would have to be used. Their experience with the sewage sludge, or perhaps they ought to call this material precipitation, at Knostrop, might be of some use to them. They would remember that when this plant was opened it was to be self-supporting, and this precipitated sludge was to be worth

about 5 $\frac{1}{2}$ per ton for manure. He was informed that they gave it away, and were glad to get clear of it. If it was true that when there was a flood the machinery was shut down, and the flood doing the work by carrying the contents out to sea without the consent of the inhabitants below Leeds, then a flood was a godsend all round, and gave the 79 feet fall from Knos-trop to the sea an extra push. Now, by the use of those locks or traps, as shown, they might have a little flood on the river every Saturday at some part of the stream, or, if they would like it better, put a sluice gate into each weir until they had cleared the sludge from the bottom of that portion they were operating on, say, from one weir to the next, and so on until the lock was cleared. He did not propose to occupy their time with the Sheepscar beck. Their distinguished fellow-citizen, Mr. Jackson, with the assistance of Sir Henry Roscoe, had that question in hand, he was informed, on behalf of the Leather Trades Association. Let him return to the river as they had it. He might ask who would be affected by either of the schemes suggested being brought into use? By adopting the trap or lock system there was no interference with the rights and privileges of the owners of the water-right. He proposed to give them in return a stream of water so far cleansed from slimy sludge, and with that a more pure atmosphere. But, while he promised that, he had that great question of the sludge to deal with. They saw how he proposed to deal with it, but that was not finding a home for it. Besides, he was not prepared to say that there was a manurial value in it, or at least enough to make it marketable. But as they had to find a home for the sludge taken from their street gullies, they might possibly find a home or use for the river sludge. There was low-lying land at different parts of the river. This land might be used. They had been filling up old quarries with the ashpit refuse of the town, so that they could not fall back on them. The West Riding Council objected to it being sent down the river outside the Leeds boundary. Now, if they adopted some kind of trap or lock situated at the several weirs on the river, the difficulty of finding a home for this sludge would be lessened. These locks would cost, say for argument's sake, 3,000 $\frac{1}{2}$ each, or 24,000 $\frac{1}{2}$ at the least for the whole. Then there would be the annual charge of attending them. This scheme, to his mind, would solve the difficulty of cleansing and keeping clean the river without in any way interfering with the manufacturers on the banks. There was one other question that existed, and that was compelling the manufacturers to abstain from polluting the river. They might ask, where were they to find a home for their effluent

refuse? They could get clear of their ashes, but manufacturers' sludge was a different matter. A scheme for removing all the weirs in the city would mean abandoning all the water-wheels. He did not know whether any one had ever thought out the question as to what the motive-power of this stream within the city was worth. Now, if they compared the King's Mills, Swinegate, with the Queen's Mills, Bradford, which was sold in the year 1869, as an example, for both of those mills were soke mills, the soke rights of Queen's Mills were valued at 12,500 $\frac{1}{2}$. Still, the whole estate was sold for 19,000 $\frac{1}{2}$, and the Corporation of Bradford bought the Queen's Mills goit, &c., for the sum of 8,300 $\frac{1}{2}$. If they averaged the seven mills at that figure, they reached a total of 58,100 $\frac{1}{2}$. And, perhaps, there would not be much difficulty in buying up all the water rights on the river—that was motive-power rights—for this sum, the water supply remaining as before, but in a more pure state for manufacturing purposes. If the clearing away of all the weirs was the result, they had to consider that the source of supply was so small, and possibly would be so far short of the demand, that by remedying one evil they would have raised a new one. If they reckoned that their works used river water for, say, ten hours per day for six days in the week—that was, they drew on the stream a steady pull of sixty hours per week, and allowed the water to continue to flow—they lost 113 hours' value of the stream, taking six at night to six in the morning, and from one on Saturday to six on Monday morning; so, if the water of their river was of value to the manufacturers, they must have preserves, as at present. To his mind, there was nothing to gain by buying up the power rights or having them given to them. So they still stood in the two positions, viz. could their manufacturers find a home outside the river for their liquid refuse? If so, would the river be cleansed by a flood once or twice a year? He could not see but that the manufacturers, to conform to such an event, would each have to have a settling tank in their yards. Of course, if they were faithful the river would then have a chance to cleanse itself, and he had no doubt that if the city fathers thought for one moment that it could or would be done in that way, every manufacturer on the banks of the river would have to carry the law into force for that end. But by the provision of public tanks or locks at different points on the river they might cleanse it and leave their trade untrammelled with such a difficulty, because the standards of purity were sure to press hard on them. Referring to the Tenter Lane goit, Mr. Horsfall said it occupied a very important part of the subject, and as it had been mixed up

with a lawsuit, he might step on dangerous ground; but, still, that goit which was about 500 yards long—that was, from Swinegate beck to the point where it entered the river—seemed to him to offer special advantages. The first was to fill it up as a sanitary benefit, as no one seemed to know of any use it was. The King's Mills would be better without it as a water-power. But that had not always been the case. He believed he was right in saying that there were two water-powers on the east side of Leeds Bridge, opposite to the commencement of the Calls. They would all remember one of them at least. Be that as it might, when the wheels were removed the weirs or sluices were left. Now, if those weirs were removed there would be no stagnant pool as there was on the west side of Leeds Bridge. The proof of that was shown by the different currents there were on that short stream, as well as the extra fall in those two tail races. Secondly, they had a lock formed in that goit needing only a filter-gate at the river end. That would be specially useful, as the sludge collected could be put on boats and sent away to fill up low-lying land below Leeds. That goit offered them a grand point for the proof that the bottom of the river must be reached before they could be assured of a cleansing process.

Mr. A. Atkinson said this was a very vexed subject, and one that needed immediate redress. The bed of the river was being filled up, and floods on the low-lying lands occurred more frequently than they used to do. Dredging should be carried out, and the original level of the river should be reached, and that would be the means of preventing floods. Mr. Horsfall's idea looked very feasible, but whether it would be practicable or not would be a question of test. He was afraid that the settling process would be a very slow process, and scarcely adequate.

Mr. Moorhouse said that the whole question seemed to resolve itself into dredging first and dredging last. He agreed with Mr. Atkinson that to purify the river bottom by a system of settling tanks would be a very slow process.

Mr. W. H. Wood could not see that settling tanks would be at all efficacious, unless they were always in operation. They forgot that Leeds had done its best to purify its own sewage, and why should they be at the trouble and expense of purifying sewage from Skipton, Keighley and other towns higher up? The remedy was to stop these places from putting their filth into the river. That was the only cure he should suggest, and if it were carried out, the stream could be made so pure that in twenty years they would be able to catch fish in it again.

Mr. B. Holgate said that, as a matter of fact, the river had been filling up for many years—long before Leeds became a large town. Alluding to the weirs, he said that the spaces between them formed settling tanks, and he did not think they could say that they got much of the mud that did not belong to them, because there were weirs above Leeds. They had got the settling tanks, and he thought the best way would be to dredge the bed of the river.

Mr. Drake agreed with Mr. Wood that what should be done was to prevent the refuse getting into the river. He did not think much of the settling process. They must look at the question from a commercial point of view, and would have to purify the stream as much as they could.

Mr. Charles Scriven stated that on looking at the river from Victoria Bridge after four or five days' holiday, he had seen the water perfectly clear. He did not consider that the weirs were much of settling tanks, inasmuch as the volume of water coming down the river and striking against the weir caused a strong eddy, which would wash the deposit from the face of the weir quicker than in the bed of the river. He did not think that the purification of the river depended upon the dredging of the bottom, but it would be brought about, as Mr. Drake had said, by compelling all those who turned their refuse into the river to purify it before doing so.

Mr. Tempest, in moving a vote of thanks to Mr. Horsfall, said that dredging would remove the accumulation of years, but it would not prevent refuse coming into the river. He believed the only way to purify the river was to prevent the refuse getting in, and then would be the time to dredge out what was in, and not before.

MOSAICS.

(Concluded from last week.)

OF all celebrated pavements perhaps the most unique is that of Siena Cathedral (thirteenth century); it is inlaid with designs in colour and in black and white, representing biblical and legendary subjects. The finest portions are beneath the domes, and depict scenes from the history of Abraham, Moses and Elijah, which are said to be executed with wonderful boldness and skill. No paper on mosaics would be complete without the mention of St. Mark's, Venice. "This church," says Lanzi, "remains an invaluable museum, where, commencing with the

Office: 175 Strand, London, W.C.

eleventh century, we may trace the gradual progress of design belonging to each age up to the present, as exhibited in many works in mosaics, beginning from the Greeks and continued by the Italians." Not having seen the mosaics of St. Mark's, I must obtain my description elsewhere, and being all supposed, as art lovers, to read Ruskin, as Christians do the Bible, I will for once forbear dragging in his honoured name. I think, though, that it would be of interest to give a short description by Mr. G. E. Street, who delivers himself thus:—"The most prominent figure is that of Our Lord, who is seated and surrounded by prophets. Below are the emblems of the four Evangelists and the four rivers of Paradise. Whilst again, in the west dome, He is surrounded by the Apostles and Evangelists, and everywhere the general scheme is a lesson to those who, nowadays, too often forget the relative importance, or the proper order and arrangement of the Divine story in the schemes they adopt for stained-glass and mural decoration; but it may be observed that wherever modern mosaics have taken the place of old ones, there at once we see a complete collapse and a loss of all good effect. This is mainly owing to the attempt which the designers made to produce effect of pictures, instead of thinking first, and mainly, of the decorative effect of their work on the building. But, at the same time, it is obvious that their eyes had lost all feeling for good colour, and that, in attempting to draw with a certain amount of academical accuracy, they had equally lost all sense of the prime necessity in such works of simplicity of arrangement and directness in the telling of their story. There is no part of the church in which some of the best of this sort of decoration can be studied with more ease than in the cloister on the north side of the nave. Here the mosaics are so near the eye, and the details and colour so fine, that one is never tired of admiring them." Mr. Street's remarks of the attempt on the part of many of the designers to produce mere pictures shows plainly the disastrous effects which the revival of the art of painting and the introduction of fresco work in the fourteenth century did to the mosaic art, which seemed to have lost its independence and its old Greek character. The mosaics from Titian's picture on the west side of St. Mark's, and Raphael's in the Chigi Chapel in St. Maria del Popolo, and many others in Rome, are striking examples of this insipid treatment. Realism is a mistake in mosaic work, and loss of freedom must inevitably mean loss of beauty. Mr. Street has much more to state in praise of the pavement. "Of all the features," he says, "of this grand church, that is, next to the gorgeous colour of the walls, is the

wild beauty of the pavement. It is throughout arranged in the patterns common in most *Opus Alexandrinum*. Instead of being made level, it swells up and down, as though its surface were the petrified waves of the sea, on which those who embark in the ship of the Church may kneel in prayer with safety, the undulating surface serving only to remind them of the stormy sea of life and of the sea actually washing the walls of the streets and houses throughout their city. It cannot be supposed that this undulation is accidental, and the corresponding example of St. Sophia, Constantinople, where we have it on record that there is an intentional symbolism in just such a floor, is conclusive as to the intention of its imitators here." The basilica of St. Maria Maggiore, in Rome, is exceedingly rich in mosaics. The pictures in square panels on the walls of the nave represent scenes from the Old Testament; those about the arch, Christ's birth and infancy, and they are looked upon as among the earliest and most interesting in Rome, as they retain that vigour and freedom and harmony which is so lamentably absent in later work. The colouring is particularly rich and beautifully blended. It would be impossible to mention the many more exquisite mosaic treasures which have been handed down to us from remotest times. The Ravenna mosaics, with their choice harmonies of blue and gold, the stately monumental mosaics of St. Apollinare Nuovo, the green and gold and silver beauties of San Vitale's ceilings, the choice and dignified ornamentation in the narthex and upper galleries of St. Sophia, Constantinople, and the golden glories of St. George at Salonica. Fortunately they remain to us, and are likely to remain, for as Titian has said of mosaic, "it is the true painting for eternity." Of Florentine mosaics there is not much to be said; they belong to a later period, and consist of inlaid work in silicious or precious stones, jasper, chalcedony, amethyst, agate, cornelian. The mode of working is as follows:—A slab of marble about $\frac{1}{8}$ of an inch thick, and generally black, is prepared by carefully cutting out with the saw and file the patterns to be inlaid; the gems are then cut and accurately fitted to these patterns in their polished and finished state, otherwise the stones, being of unequal hardness, would in some instances wear away too quickly. After the surface is thus prepared it is veneered on to a thicker slab, and is then complete. Some examples of Florentine mosaic are to be found in India. It is a sectile mosaic, and was introduced into India by Italian workmen in the seventeenth century. The best of these examples are to be found at Agra. Mosaics of coloured glass, pastes and precious stones, somewhat similar

to the modern Florentine mosaics, were used by the Byzantines in the decoration of their ceilings and in wall-pictures.

As we approach more modern times the subject grows less and less interesting. There was some sign of revival in the mosaic art of the seventeenth century. In the Vatican there is a workshop devoted entirely to preparing mosaics for St. Peter's, and at the Monreale Cathedral there is a similar establishment. Sir Christopher Wren fully intended to have the cupola of St. Paul's decorated with mosaics, and had even gone so far as to enter into negotiations with Italian workmen for this purpose, but was not permitted to proceed with the work. The St. Paul's of Sir Christopher Wren's time has undergone a wonderful interior transformation, and it only remains for many of those fusty, broken-nosed and vulgar monuments of our great men to be heaved into the Thames, and for the great work of mosaic decoration which is now being undergone to be completed, and St. Paul's will indeed be a temple fully fitted for the worship of the Greatest Architect of all. The late Alfred Stevens, who designed four of the glass mosaics to fill the spandrels under the whispering gallery of St. Paul's, takes premier rank among modern mosaicists. The subject of his work was the four great prophets, and the treatment is grand and imposing. Mr. G. F. Watts has designed the four corresponding figures of the evangelists. These are now, I believe, all in position. The decoration of the east end of the cathedral, which Mr. Richmond is undertaking, and has been employed on for the last two years with twenty-five assistants, will, it is stated, take another ten years to complete. The interior of the great dome is also to be decorated by this artist. Signor Salviati has also done much for mosaic work in England. The spandrels of the Albert Memorial were executed by him, after cartoons by Clayton & Bell. Of this work the late Sir Gilbert Scott says:—"This admirable branch of art, so gloriously carried out in the later periods of Roman and Byzantine art and in the Middle Ages, and which seems in so marked a degree to be special handmaid of, or rather the sister art to, architecture, has been revived in all its pristine perfection by Signor Salviati." Salviati also executed a mosaic picture of the Last Supper for the altar of Westminster Abbey. Mr. Lewis Day considers that Salviati has received an undue share of credit for the mosaic revival in England; still he must have the credit at least of initiating it. Mr. Day, after speaking of his persistent energy and business ability, says:—"For the rest, the repute of English mosaics (good or bad) is due neither to Dr. Salviati nor to Sir Gilbert Scott, but to the

artists who designed them." Well known amongst these may be mentioned Mr. John Clayton, Mr. S. Bell, Mr. Burne-Jones and Mr. Walter Crane. With these fond workers there is a future yet for mosaic work. When boldness, breadth and beauty in blending, when the consideration of aptness of surroundings, when the study of grand pictorial composition and effect shall have taken the place of narrow academic precision, strained pictorial effect, inharmonious blending, and studied, inappropriate picturesqueness, then the decorative glories of the Byzantine temples, and of the Roman basilicas may be repeated, and we may hand down with confidence to posterity the work which is "the true painting for eternity."

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 17621. William Smith, for "Improvements in the manufacture of bricks or building blocks."
- 17628. Henry Bartlett, for "Improvements in syphon cisterns for water-closets and other purposes."
- 17633. Heinrich Hase, for "Firebar."
- 17655. Frederick James Orwin, for "Improvements in chimney-pots and the like."
- 17697. Arthur Coleman, for "Improvements in and connected with the construction of window-sashes."
- 17797. John Kennedy, for "An improved window-fastener."
- 17821. Robert Thomas Bells, for "New or improved apparatus or device for testing for leakage in drains or other pipes."
- 17857. Joseph Goulson, for "Thief-proof window-bolt."
- 17862. Charles Smith, for "Improved syphon-tank for flushing water-closets, lavatories and the like."
- 17920. William Clark and Arthur William Rammage, for "Improvements in fireproof floorings."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE

PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208.
Special thrust motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

THE sanitary committee of the Commission of Sewers have prepared a report recommending that the Remembrancer and the Solicitor should be instructed forthwith to take the necessary steps with a view to the introduction of a Bill into Parliament to obtain the necessary powers at the earliest moment to provide baths and washhouses within the City, and that in the meantime a draft Bill should be prepared. The report was adopted on Tuesday, it being understood that the acquisition of the necessary powers—which the City Commission did not now possess—was the only object of the Bill, and not necessarily the erection of the buildings, which a member said would cost 100,000l.

THE SALBERG SANITARY DUST-CARTS AND BINS.

WE had recently an opportunity to inspect a notable improvement in sanitary appliances, which has already been officially tested with complete success in France, Germany, Austria and Belgium, and with which our municipal and parochial authorities would do well to make early acquaintance. It is an automatic disinfecting dust-cart or van, the patent for which in all countries is held by the inventor, Mr. Frederick Salberg, whose London representatives are Messrs. F. W. Decker & Co., of 92 Great Tower Street, and Walbrook.

The principle of the invention is as efficient as it is simple, and is briefly as follows:—The cart or van is a covered vehicle having at either side at a convenient height a valve or flap, against which the house or other refuse is tilted. This by its weight, however slight, opens the valve, and is deposited in the cart, when the valve automatically closes, and at the same time a given quantity of dry or liquid disinfectant is distributed over the refuse from an ingeniously-contrived receptacle actuated by the closing of the valve.

Thus all the annoyance and danger to public health caused under the old system by the cloud of dust, with its germs and microbes which is disseminated with every basketful of refuse emptied into the open cart, or by the wind as the cart is proceeding through the streets, is obviated, as well as the unsightliness and the unsavoury odours of decayed animal and vegetable matter which usually forms so large a proportion of the contents. The carts, which will cost little more than those in present use, are adapted for scavenging and all kindred purposes; they are easily emptied and, being lined with galvanised iron, equally easily washed out. The apparatus can, moreover, be fitted at small expense to existing carts. Mr. Salberg is also introducing an automatic disinfecting dust-bin, which is on somewhat similar lines. A galvanised-iron tank of cylindrical form, with a hermetically-fitting flanged top removable for convenience of emptying, has in the latter a valve-lid which closes automatically, sprinkling with each movement a small quantity of disinfectant over the newly-deposited refuse. The supply of disinfectant contained in each bin is sufficient to last six months, and when exhausted it can be immediately replaced at a nominal cost, while the price at which the bins will be retailed is such as to place them within the reach of the humblest *ménage*.

TRADE NOTES.

THE new Infectious Diseases Hospital, Whitehaven, is being warmed by means of Shorland's patent Manchester grates and patent Manchester stoves, with descending smoke flues, and ventilated by means of Shorland's patent exhaust roof ventilators and inlet panels, the goods being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE understand that Messrs. Thornton & Son, of Liverpool, have secured the contract for the superstructure of the new Post Office in Victoria Street, Liverpool. The amount of the contract is stated to be about 112,000*l*.

THE gold key to be presented to Sir John Harwood on occasion of opening the Thirlmere Waterworks for Manchester city has been designed and executed by Messrs. Elkington & Co.

MESSRS. PEACE & NORQUOY have been awarded the prize medal by the Sanitary Institute of Great Britain at the Health Exhibition, Liverpool, for the excellence of their folding partitions. As far as we are aware, this is the first medal ever awarded for folding partitions.

THE extensive offices of Mr. George Brinsley, New Bridge Street, Ludgate Circus, E.C., are being warmed by low-pressure hot-water apparatus, including a number of Parsons's radiators, the whole work being carried out by Messrs. H. Parsons & Harris, heating engineers, of Sidney Grove, Goswell Road, E.C.

BUILDING AND BUILDERS.

AT the meeting of the Glasgow Dean of Guild Court a builder was fined ten guineas for deviating from the plans passed by the Court.

THE London and India Joint Docks committee have decided to erect on the north side of the West India Dock storage accommodation for 100,000 sheep, together with sidings, which will place the stores in direct connection with the general railway system of the country. The railway communication will also be used for grain and other produce coming to the dock, and the stores will be constructed on the same principle as those at the Victoria and Albert Docks, which have given entire satisfaction to the importers of colonial and foreign meat.

THE provisional committee formed for the promotion of a new line from Manchester to the north have chosen Newcastle as their headquarters. They have also resolved to proceed with a Bill in the session of 1895.

VARIETIES.

THE Local Government Board have sanctioned a loan of 11,500*l.* for works of sewerage and sewage disposal at Bracknell. The sewage will be purified by irrigation on 22½ acres of land. There are to be two small pumping-stations worked by oil-engines. The engineer to the scheme is Mr. W. H. Radford, C.E., of Nottingham.

WE have received from Mr. Peter Cowell, chief librarian of the Liverpool City Free Public Library, a hand-list of the extensive and important collection of architectural works in the library. To make the contents of the library better known to specialists, some little while ago he recommended his committee to publish a series of hand-lists, or brief catalogues, of certain important classes of books. The committee approved of the suggestion, and this hand-list is the first of an intended series, if it prove successful. The "Hand-list of Technical Works," published in 1892 and distributed freely through the workshops of the city, had a marked effect on the demand for works from the library and branch libraries bearing on the various handicrafts.

AT Leamington an inquiry was held by the Local Government Board at the Town Hall into the application of the Town Council to borrow 4,700*l.* for various public improvements. It was stated that 1,000*l.* of the amount required was for the extension of the adits at the waterworks. Other items in the amount required were for river water supply, new river walk improvement, river wall and new sewers. There was no opposition.

THE Midland Railway Company lately started a train service to Southend, and it is stated they propose to construct a pier and docks at Leigh.

THE Hammersmith Vestry have under consideration a proposal to construct a new lock at Battersea. It is said that since the construction of the Richmond Lock and the erection of the Tower Bridge the flow of the river has decreased so much that navigation is rendered almost impossible near Hammersmith.

IN the course of a short article the *Standard* says:—The proceedings of the County Council with reference to the southern approach to the Tower Bridge contain no promise of the speedy carrying out of that important project. The Council seem in no way disposed to abandon the *non possumus* attitude they have adopted from the first, if we may judge from

the report which has been drawn up by their parliamentary committee. Out of mere pedantry the Council are allowing an important line of traffic to be seriously embarrassed and a splendid bridge to be deprived of nearly half its value to the teeming population of South London.

A GROUP of twelve cottage almshouses, under the will of the late Mr. Thomas Lockerby, Addiscombe, Surrey, have been erected and opened at Burnhead, near Liberton, at a cost of between 5,000*l.* and 6,000*l.* Mr. Lockerby was a native of Edinburgh, who died in 1887, leaving about 30,000*l.* to found almshouses for persons in reduced circumstances. Messrs. M'Whannel & Rogerson, Glasgow, were the architects.

THE *Glasgow Herald* says:—The want of water and the scarcity of coal in the Campbelltown district is preventing the distilleries from making a start for the season. In Stranraer also a water famine is in immediate prospect.

THE Blackpool Corporation have decided to purchase, at a cost of 32,000*l.*, three large estates to the north of Claremont Park, for the purpose of constructing a new promenade and carriage-drive, with a view to adding an extensive suburb to the town.

AT a conference held at Liverpool between representatives of cattle importers and the Mersey Docks Board with regard to the provision of further accommodation for the growing trade in United States cattle at that port, it was agreed that the best scheme would be to enlarge the present lairage at Woodside, and it is understood that about 100,000*l.* will be spent by the Mersey Docks Board in carrying out the project.

THE works committee of the Edinburgh and District Water Trust have adopted the recommendation of the sub-committee in favour of the Tweed scheme for an additional supply of water.

THE death is announced in Paris, at the age of forty years, of M. Geneutte. He had exhibited at the Paris Salon since 1876; his pictures, depicting street scenes in Paris, were evidence of great ability and originality.

PROFESSOR BOYD DAWKINS recently paid a visit to the museum at Tullie House, Carlisle, and examined the extensive collection of Roman remains, some of which turned out to be Celtic, and as they had been dug up in various parts of the city they thus furnish conclusive evidence that Carlisle was a Celtic settlement prior to the Roman occupation. One of the specimens enabled him to decide the process by which the Celts did their enamelling, namely, by fusion and not inlaying.

THE Swansea Harbour authorities have decided to seek powers during the next session of Parliament to construct a new bridge at a cost of between 25,000*l.* and 30,000*l.*

HARROW-ON-THE-HILL.

THE new Roman Catholic church of "Our Lady and St. Thomas of Canterbury" will be opened on Tuesday, the 16th inst. The small church or chapel which has so long been in use had become inadequate for present purposes. It was determined to build a new church on a different and much more convenient

Dr. Patterson,* Bishop of Emmaus, being present. The church has been designed by Mr. Arthur Young, of 4 Iddesleigh Mansions, the builders being Messrs. Turner & Son, of Watford.

ANTWERP EXHIBITION AWARDS.

IN the list of awards granted to the British exhibitors at the Antwerp Exhibition the following names appear:—

Diplomas and Medals of Honour.—Mr. Alma-Tadema, Sir John Millais, Messrs. Miller & Richard, Atkinson Brothers, Hampton & Sons, Tangyes (Limited), the Lancashire and Yorkshire Railway Company, the London, Chatham and Dover Railway Company, Chubb & Sons, Howard & Sons and F. B. Kent & Sons.

First-class Medals.—Sir Edward Burne-Jones, Mr. Henry Davis and Mr. Henry Moore.

Gold Medals.—Waterlow & Sons, Chubb & Sons and Holland & Holland.

Awards have also been granted to the following:—

Musgrave & Co., Pain & Co., Chubb & Sons, Davis & Co., the Great Eastern Railway Company, the London and South-Western Railway, the Orient Steam Navigation Co., the Royal Mail Steam Packet Co. and the Union Steamship Co.

NOTES ON NOVELTIES.

WE have recently inspected the patent autocopyist now in general use for the reproduction of circulars, plans, sketches, &c. This apparatus, illustrated below, has the unique feature of copying direct from the ordinary pen in clear black lines, so that it is available for general business routine. The autocopyist is supplied with everything complete for instant use, including one dozen sheets of parchment, inks, brushes, &c. The method of using these is as follows:—One of the prepared parchment sheets is moistened with water, fastened down to

the frame, and after placing the original on the parchment for one minute, an absolutely correct negative will at once appear on it. The printing roller is now passed over the negative, which only will take the printing ink, and in its turn render it to the sheets of paper placed upon it, thus producing clear copies of the natural handwriting, &c. with absolute precision, only to be equalled by lithography. By sprinkling special transfer powder prepared by the Autocopyist Company over

the copies they act as fresh originals for many months. We have seen the autocopyist in operation, and can testify to the remarkable expedition with which reproductions are taken, and to the absolute correctness of the facsimiles. Moreover, the autocopyist has stood a practical test of several years, and remains the apparatus most generally used. We should suggest that the autocopyist should find much favour with architects anxious to send out quantities, specifications, &c. as quickly as possible. This method will certainly be much more economical all round than the old one. The address of the manufacturers is the Autocopyist Company, 72 London Wall, London, E.C., and they will be glad to submit specimens of work done by their patent.

JUNIOR ENGINEERING SOCIETY.

THE annual meeting of this Society was held last Friday evening at the Westminster Palace Hotel, Mr. P. J. Waldran in the chair. A satisfactory report of the affairs of the Society was submitted. The number of members is 373, showing a net increase of 13 3 per cent. A tribute was paid to the late Dr. John Tyndall, who showed much interest in the progress of the young engineers. Nine meetings had been held during the session, at which papers dealing with technical subjects were read. The premium for the best paper was awarded to Mr. G. F. Burt (Brighton) for his contribution on "The Design and Construction of Boilers for Locomotive Engines." The presentation will be made at the opening meeting of the new session. Visits to important works had maintained their position as one of the most useful objects of the Society, and the Council expressed their thanks to the various proprietors who had thrown open their works to the members. Among those visited were the Tilbury Docks, the Tower Bridge, the Battersea Polytechnic, Wembley Park Tower and the steamer *La Marguerite*. The summer excursion to Cardiff gave the members an opportunity of viewing the Barry Docks. During the year two Whitworth Exhibitions had been gained by members, Mr. Frank Fisher and J. N. Boot. By invitation of the Technical Education Board of the London County Council delegates were appointed to the conferences held in June and July, to promote technical education in the interest of trades. After the adoption of the report some discussion took place as to the advisability of changing the title of the Society, and it was eventually decided to call it "The Institution of Junior Engineers."

THE BUILDING TRADE IN GLASGOW.

ON the 4th inst. the retiring Lord Dean of Guild, Sir James King, made the customary annual statement. He said that as that was his last appearance as Lord Dean of Guild, he wished to express the great satisfaction which he found in the important powers possessed by the Court since he first presided there. The powers were purely administrative, but that did not prevent the Dean from bringing before notice in the proper quarter the defects which he found in the powers entrusted to him. During his former term of office they were hampered in many ways, but he found many independent reformers among his colleagues in the Town Council. The building regulations were framed, and by petition to the then Home Secretary, and by other means, they endeavoured to have them carried into effect. The public at that time had not, however, fully awakened to the value of complete and perfect control over the erection of their houses. Still the seed sown very soon ripened into harvest, and through the zeal, energy and tact of Bailie Crawford and Bailie Primrose, aided by the then Dean, his excellent friend the present Sub-Dean, and the Deacon Convener, who stood shoulder to shoulder, many beneficial improvements were made. Eighteen years had passed since last it was his duty to review the business of the Court, and it was now his duty to refer to the work of the past year, although a very small proportion had been done by himself, the greater part having been well and ably done by the late Dean, who, after a long and honourable career, had now entered into his rest. During the two years in which he held office formerly, the extent of the building operations was greatly in excess of all previous or subsequent experience. The estimated total cost of erections and alterations in 1874-75 was 1,826,150*l.*, and in 1875-76 2,125,249*l.* This building craze was followed by a long and severe depression, from which property had even yet only partially recovered. The last few years had shown increased activity and a marked increase in the number of properties, even after making allowance for the proportion due to the extension of boundaries. The increase had been especially large during the last two years, the valuation of operations authorised by the Court having been in the year ending August 31, 1893, 1,330,680*l.*, and in the year just finished 1,275,445*l.* The details of the past year were briefly as follow:—Houses erected of one room, 470; two rooms, 1,519; three rooms, 874; four rooms, 369; five rooms, 89; and six rooms and upwards, 145. The total number of houses erected in the past year was 3,466, and of

shops 123. The estimated cost of the erections was 785,950*l.*; alterations and additions, 241,310*l.*; and public buildings, warehouses, &c., 248,185*l.*—making a total of 1,275,445*l.* In addition twenty-one streets had been authorised, extending to about five miles. The total linings passed was 623, or an average of 26 linings at each meeting of the Court. The number of linings for houses passed in 1894 was greatly in excess of any previous year since 1876, being, as stated above, 3,466, as compared with 2,573 in 1893. The number of houses of six rooms and upwards erected this year was 145, as compared with seventy-nine last year. Nearly the whole of these large houses were erected in outlying districts of the city. The average number of houses erected in the fourteen years from 1877 to 1891 was only 224. They had heard a great deal of life in one-room houses, and it might be interesting to note the relative proportions of small and large houses which were being erected at the present day as compared with the proportions twenty years ago, when he formerly held office. Houses of one room erected in 1875 formed 20 per cent. of the total number of houses built, in 1876 17 per cent., in 1893 13 per cent. and in 1894 13½ per cent. Two-room houses in 1876 formed 47½ per cent. of the whole, in 1876 48½ per cent., in 1893 44 per cent. and in 1894 44 per cent. Three-room houses in 1875 formed 32½ per cent., in 1876 34½ per cent., in 1893 43 per cent. and in 1894 42½ per cent. Small houses were not necessarily unwholesome or the large houses clean and healthy. Sir James King concluded by expressing his deep acknowledgment to his brethren the liners for their valuable assistance and for the amount of time they ungrudgingly bestowed on the work. He was glad to see that Mr. Lang and Mr. Whyte were still discharging with the same intelligence and the same courtesy the important duties which devolved upon them. He also expressed his acknowledgment to the other officials of the court, and thanked the procurators who with the skill and clearness which was characteristic of the profession in Glasgow placed their cases before him, and thus saved much valuable time to the whole of the committee.

BEFORE deciding upon the details of the proposed new Naval Barracks at Chatham, which will be on a somewhat extensive scale, the Lords of the Admiralty will consider a report upon the subject which is being specially prepared at their request. The conversion of the old prison buildings will form only a very small part of the scheme.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c. - DISMANTLING, CARPET-BEATING, &c.

CAXTON CONVALESCENT HOME.

MORE than four hundred printers and their friends took special train from London Bridge on Saturday afternoon for Oxted, to witness the laying of the foundation-stone of a convalescent home there. They were accompanied by the Lord Mayor and Lady Mayoress, Mr. Sheriff Hand, Mr. and Mrs. Passmore Edwards, Mr. C. J. Drummond, Mr. W. H. Collingridge and others. The weather unfortunately was at times wet, so that the full benefit of a jaunt to one of the loveliest spots in Surrey could not be enjoyed. Oxted Station was only a part of the way. The home, which will be known as the Caxton, is at Limpsfield.

The new home will be situated on one of the finest sites in the kingdom, with views from the front door over a stretch of hill and dale, pasture and woodland, which will be hard to equal anywhere. The building is being erected on the Chartlands Farm Estate, adjoining Limpsfield Common. The site (which with the grounds is about nine acres in extent) is just below the crest of the hill, and is well sheltered from the north and east. The building comprises a two-storeyed block, with returned gabled ends, containing day-rooms, dormitories, &c., for fifty male patients, with one-storeyed extensions in the rear for administrative offices. Advantage has been taken of the quick fall in the ground from north to south to construct a basement at the south end of the main block, to contain, besides large cellarage, a smoking and billiard room, cloak-room and lavatories. The patients' general entrance is also on this floor. Provision is made for the construction in future of a number of additional rooms in the roof of the building to accommodate twenty-two patients. A small bedroom is provided in the tower below the cistern chamber, and above the latter a "sun" room lighted on all sides. The dormitories, when fully occupied, will allow a minimum of 750 cubic feet for each patient, and special care has been taken to secure ample light and ventilation throughout. All rooms are provided with open fires, and the corridors will be heated by low-pressure and hot-water pipes. The external walls generally will be faced with red bricks, relieved with Monk's Park Bath stone dressings, the upper storey being hung with red plain tiles. The roofs will be covered with brindled plain tiles. It is at present proposed to erect the centre portion only of the building, to accommodate twelve patients, and the cost will be defrayed entirely by Mr. J. Passmore Edwards, the

president of the institution. The architect is Mr. A. Saxon Snell.

The ceremony of laying the foundation-stone was performed by the Lord Mayor.

BELGIAN COMPETITION IN IRON AND STEEL.

ONE of the members of the Iron and Steel Institute gives the following account of his experience during the recent meeting in Brussels:—While our coal-mining centres throughout Scotland are engulfed in the very worst possible form of stoppage which can overtake any industry, it may be interesting as well as instructive to show what our continental neighbours in the iron and steel manufactures are doing. Of course, iron and steel production in any country is so inseparably bound up with coal-mining that whatever influences the one is bound to affect the other. The miner has, therefore, largely to thank iron and steel producers for consuming the fuel which his labour raises. Clearly such consumers are amongst his best friends. Without entering into the question of who is to blame for the present national coal strike, with its far-reaching and deadly effects, which no time almost will ever quite efface these very iron and steel manufacturers of our country, along with their workmen, wives, children and other dependents, to say nothing of the countless thousands in other fields of industry, are unfortunately the greatest sufferers, and consequently the innocent victims of the present stagnation in coal production. A terrible responsibility therefore rests on someone's shoulders. As a member of the Iron and Steel Institute of Great Britain I have just returned from taking part in the autumn meeting, which has been held this year in Brussels. In the course of our peregrinations we were not only hospitably entertained everywhere, but we were also accorded the exceptional privilege of visiting and thoroughly inspecting the blast furnaces and iron and steel rolling plant of three of the best establishments in Belgium. I had often heard and read of Belgian and German competition in iron and steel production, but had never the opportunity of seeing it for myself until now, in the former country. I had fondly cherished the belief, which is to my knowledge a common one, that Great Britain holds an unassailable industrial supremacy in the manufacture of iron and steel from the crude ore onwards, due

to the magnitude of her industries, the size of her blast-furnaces, the power and high speed of her rolling plant, along with the outstanding superiority of her workmen, resulting inevitably in cheaper and better finished products in iron and steel. I am reluctantly compelled to admit that this opinion has received a severe shock from my recent visits to the Belgian iron and steel works. As a practical man, having over twenty years' experience in the iron and steel trades of Scotland, I have no hesitation in saying that our continental neighbours have shot so far ahead within the last few years in iron and steel production, that a condition of matters now exists there which compels our most earnest attention, not only to hold our own, but really to prevent us taking in a very few years from now what is vulgarly, but very tersely, termed a "back seat." The expression exactly conveys the position we are approaching, and I am convinced that it is only by pursuing the paths of industrial peace that we can successfully cope with the intelligent and determined competition directed against us so mercilessly.

I now proceed to state as accurately as possible what we saw at the three iron and steel works we visited, without going too much into technical detail. The first establishment inspected was the works of the limited company, Marcinelle & Couillet, at Couillet, about four hours' run by train from Brussels. These works were established in 1835, and consist of blast-furnaces of the most modern type—there is nothing better to be seen in either England or Scotland—Bessemer department, Siemens furnaces, rolling-mills, &c. On stepping from the special train kindly provided for the members of the Institute the first thing that caught the eye of the expert, next to noting the magnitude of the establishment, was the extreme order that prevailed everywhere. Everything seemed to be in its place, and the stacks of material in the yard were most carefully piled and marked for future reference. A close inspection of the blast-furnaces, blowing-engines and all their auxiliaries called forth nothing but the highest praise on all sides. The works are equipped with the most modern appliances in every detail. The methods are on a par with the plant. We saw a blast-furnace tapped into a ladle. This operation over, the liquid metal was immediately taken to the Bessemer department, and in about twenty minutes converted into steel of a quality suitable for rolling into girders, angles or bars. This is apparently their daily practice, no intermediate process of cupola-melting of pig being used, which must cheapen cost of production very

much. Any experts reading this statement will at once see that we have here the best and most modern practice yet attained in our home industries in full and apparently successful operation in a foreign country which we have scarcely taken time to seriously notice hitherto. From the Bessemer department, with its massive converters and magnificent hydraulic crane plant, working smoothly and noiselessly, as if controlled by some hidden spiritual force, we wended our steps towards the rolling mills department. I was not prepared for the high efficiency of rolling plant that here met our eyes. Mills with three rolls high seem to be more in favour with Belgian engineers than the reversing mills to which we pin our faith in this country. I looked carefully at the engines of their largest rolling mill—there were four mills in all—and I am compelled to admit that I never looked upon engines that conveyed a greater impression of power. The engines consisted of three high-pressed cylinders, about 50 inches in diameter each, and connected to a three-throw crank shaft, from which the large mill was driven direct without gearing at an enormous speed. It was quite a treat to see these Belgians take an ingot of steel and roll it off in one operation into a finished girder 12 inches by 6 inches, and in lengths of 70 to 80 feet. It was difficult for a moment to resist the impression that instead of being in a foreign country we were watching the operation in Middlesbrough, or some other British manufacturing centre. The girders when finished were beautifully straight, and the material itself had all the appearance of good quality. It is unnecessary to say anything more of the other, and smaller, mills, which were all busily employed in rolling ordinary round and flat bars after the manner of our own practice and in every way as efficiently. The Belgian iron and steel worker is apparently a smart fellow, amenable to discipline and of fairly good physique. He is more contented than his English prototype, and works longer hours for less wages, seems to be happy and bears no evidences of dissipation. Before leaving Couillet Works I may mention that 6,000 hands are employed in the coal mines, blast-furnaces and iron and steel works, and the yearly production is stated to be 150,000 tons of steel. While writing I have before me a small pamphlet which was presented to us while at the works, containing a note and a short history of the workmen's institutions in connection with this immense establishment. It is most interesting reading. It begins with the "Construction in 1836 of the first group of houses to workmen;" "Establishment of insurance fund against accidents and old age;" "Organisation

of the medical service." 1847. "Construction of the hospital of Couillet;" then follows infant school, drawing school, elementary school, music school and music band; subsidy to a school for adults; construction of houses for the account of workmen; distribution of suppers to the men; distribution of flour at cost price to the men and establishment of a bakery; establishment of a housewifery school; establishment of a savings bank in 1875." This is the last event recorded, and a very good finish it is. It thus becomes apparent that Belgian employers regard it as a part of their duty to see to the comfort and well-being of their workers, apart from actual work, and to provide amusement as well as instruction. These must be all-powerful influences for peace and goodwill amongst employers and men, the whole tending towards one happy family and rooting the workers to the soil, on which they apparently live and die. So far as I could learn disputes are few and strikes are rare.

On the following day we visited in the early part of the day the works of the Angleur Steel Company at Liège, where we saw another highly efficient plant on a somewhat lesser scale, although not so very much behind that at Couillet. In the afternoon we went to the greatest establishment of all, the works of the Cockerill Company at Seraing. The immensity of this place beggars description. It comprises blast-furnaces, rolling-mills, foundries, workshops, artillery and shipbuilding departments, &c.—too much, in fact, to take in all at once, yet harmony and order apparently prevail everywhere. "Courage to the last" is the heraldic motto over their establishment, and it will assuredly be required in handling this leviathan iron, coal and steel producing work. The same order, neatness and working expertness were all doubly emphasised here, and I left Belgium and the three beforementioned works with a strong impression that they are not only difficult to excel, but that if we do not keep our weather eye open in our manufacturing centres in Great Britain we shall eventually be beaten in the struggle for supremacy in the iron and steel trades. The close connection between the coal-mining and the iron and steel industries appears from the fact that it takes not very far short of four tons of coal to make one ton of finished iron or steel, counting from the time the ore enters the blast-furnace until it reaches the finished state. Our continental neighbours can produce even more cheaply than our home manufacturers. This has received confirmation since my return, as I have learned of a repeat order of 5,000 tons of finished steel for a foreign house having been placed with German manu-

facturers by a Scotch merchant of long standing at such a price as could not be looked at in either England or Scotland. I may also mention that I was informed by a Belgian merchant that he was delivering steel boiler plates into Italy, orders which used to come to the West of Scotland. It is thus apparent that we are losing our trade in foreign markets for iron and steel, and that the industrious and contented Belgians and Germans are quietly but surely securing it. I said foreign trade, but this must be qualified. Let us look around in our own city, in London and elsewhere, and note the vast amount of steel and iron in the form of girders which now enters into the construction of all modern buildings. Where do all these girders come from? Why, from Belgium. The imports of other forms of rolled material, such as tramway rails, sheets, bars, &c. are undoubtedly on the increase. But enough has been said to show that the position has become sufficiently alarming, and I hope the intelligent iron and steel-workers and miners will realise the situation. A shrinkage in our iron and steel production through successful foreign competition means a lessened demand for coal, which simply means less work and lower wages for the miners. Is there no way in which this deadly competition can be met? Yes, there is yet a ray of hope. Coal abundant in supply and cheap in price is the key to the position. Strikes and lock-outs and all such barbarous methods must for ever cease, and that with the least possible delay, unless capital is to be extinguished and labour go a-begging. Do the miners for one moment suppose that the masters are not as sick and sorry over the past twelve weeks of idleness as they are, and the bigger losers of the two? There is still enough of brain and muscle power and technical skill and capital left to successfully compete with the foreigner both at home and abroad, but these must all be industriously applied in the right direction. From what I have recently seen in Belgium, I would advise the Scotch miners to take warning and return to their work without delay. Let it be understood thoroughly by the miners that large profits in manufactures are not made nowadays, and that it is only by the large output that concerns can live and return a fair profit. The labour of the miner is not exempt from the same law. He must work six days per week and make a good wage by output. Restricting output and artificially raising the price of fuel can only end disastrously for all concerned, and not the least pernicious of its effects is seen in the success of our foreign competitors.

PUDDLED IRON AND STEEL INGOTS.

THE first meeting of the session of the South Staffordshire Institute of Iron and Steel Works' Managers has been held at the Institute, Dudley. Mr. Thomas Ashton, manager, Netherton Ironworks, delivered the presidential address. He remarked that it was a matter for mutual congratulation that they were commencing another session under such favourable auspices, each department of their work presenting satisfactory evidence of the stability, prosperity and progressive character of their Institute. The iron and steel trades were now passing through a transition more serious than had ever before been experienced; not the natural and healthy transition of youth to stronger and more fully-developed conditions, but one containing elements of danger to the healthy supremacy, if not to the very existence, of iron-making by the long-existing process of manual puddling. Ever since the introduction of steel and iron making by the Bessemer, basic and open-hearth processes a steady and continuous inroad had been made upon the domain where for nearly one hundred years puddled iron had held undisputed sway. The advance, which at the outset was comparatively slow, had during the last few years quickened into a formidable attack, the advancing force hoisting its flag and permanently annexing many districts seized and points of advantage gained in its onward and triumphant march. That these statements were not mere figures of speech introduced to round a period was sternly demonstrated by the statistics recently issued by the British Iron Trade Association, and which had accentuated the fears long existing in the minds of puddled iron-makers that ingot-iron might displace weld-iron made by the puddling process. In 1882, 2,841,534 tons of puddled bars were introduced, against 1,363,974 tons in 1892, representing a decrease of more than 50 per cent. On the other hand, the production of open-hearth ingots increased during the same period from 436,000 tons to 1,400,000, an increase of nearly 1,000,000 tons. With those figures before them, the important question for them to consider was whether puddled or weld-iron was doomed, or was it being driven into a much restricted and limited area, where, by its own inherent and specific qualities, it could successfully prevent any further advance of its formidable antagonist? In other words, would there permanently exist any special purpose for which weldable fibrous iron was better adapted than rigid homogeneous iron? They believed such was the case, notwithstanding the persistent and not altogether dis-

interested attacks upon iron by a certain class of steel-makers. Given a basis of suitable materials, of which there remained practically unlimited stores, skilfully manipulated through the various processes of manufacture, a more uniform and reliable metal could be obtained by the puddling process for every requirement where a ductile, weldable material was essential, than by any known process of steel-making. The results of exhaustive experiments, made by various engineers, had conclusively proved that the ultimate strength of steel was less than that of iron when both had been subjected to a succession of equal heats in order to manipulate them into any required form or shape. For this reason a marked reaction had taken place in favour of a high class of iron for engineering and locomotive work. A case had recently come to his knowledge where a railway company, after a lengthened and thorough trial of steel gearing and couplings, abandoned them, finding that they were not to be relied on, and refitted the whole of their rolling-stock with others made of iron. The results of tests of Staffordshire iron taken from the bar in its normal condition, and of the same iron after being made into chain, proved that it was not yet played out, the results showing that the samples of iron so tested contained the chief virtues of steel without its vices, and in addition possessed high valuable welding properties not to be found in steel. The destruction tests showed an average of more than 120 per cent. over Admiralty requirements, thus clearly proving the strength and perfection of the various welds. In addition, it was well known to metallurgical experts that in casting steel ingots the impurities were not uniformly distributed through the metal, but segregated and settled in some part of the ingot, causing what were locally known as pipe-holes, which, as the purer metal contracted in cooling, left it, thus forming a cavity, in which was secreted an element of weakness and danger that invariably passed unobserved through subsequent workings of the ingot, only to be discovered when, under the strain of actual work, the defective bar or plate suddenly failed, to the chagrin and loss of the user. But while iron of a high-class quality might and would be preferred to steel for purposes already referred to, yet for heavy sections used for structural work, or when a hard resisting surface was required, as in the case of rails, &c., steel had very largely displaced iron. The effect of this displacement was seen in the stoppage of so many ironworks throughout the country, and ironmakers of world-wide renown had had to succumb to the loss of trade in consequence. One effect

of the competition of steel had been to awaken those ironmasters who had survived the onslaught to the necessity of improving their machinery and appliances, so that by a more economical production of a higher class of iron they might retain that portion of their trade for which iron was now proved to be best adapted. The remnant trade for iron would undoubtedly fall into the hands of those makers who could most economically and efficiently produce the class of iron required. Whilst admitting that the outlook for the iron trade was sufficiently serious, yet it was far from being *in extremis*, and if manufacturers and workmen bated not heart, hope, or effort iron would for many years to come be one of the staple trades of the district. He advocated the relegation of all wages and labour questions to the humane and intelligent arbitrament of equitably-constituted conciliation boards. The long decade of trade depression was slowly, yet surely, passing away, and in the not very distant future—probably in the coming year—the favouring causes observable in the chief trade centres of the world, together with the bountiful harvest of our own land, would culminate in a steady and substantial revival in every branch of trade and commerce. Such hopeful and brightening prospects were most encouraging, and foreshadowed a return to the activity and prosperity of former days, a desideratum which would nowhere be more heartily welcomed than in their own immediate district, where the cloud of depression had so long existed.

Mr. W. B. Rubery, in opening a short discussion, said that the nearest approach to good weldable iron that he had seen had been a combination of iron and steel, and he did not think they need fear the entire absence of iron making in that district. It was, no doubt, a serious thing that there was such a large falling off in the manufacture of iron, but they must not forget that they were the advocates of both iron and steel, and where the former failed they must be prepared to supply the demand for the latter.

Mr. G. Williams believed that for general purposes iron would continue to hold its own. For constructive purposes steel was lighter, but it required a very free use of the paint brush, as was shown by the experiences in connection with the Forth Bridge.

Mr. Edwards said that experience had shown that steel, when subjected to the various processes of welding, was not at all times uniform, which was one of its most serious drawbacks. On the other hand, good iron could always be relied upon for welding purposes, and it was satisfactory to know that South Staffordshire, in spite of all the new processes brought forward, had maintained its name and fame for iron of a high-class quality.

In proposing a vote of thanks to the President for his address, Mr. J. Roberts said it was perfectly true that steel was liable to many failures, especially when used for welding purposes, but possibly the users of steel were quite as much to blame for this as the makers of it. In the first place, in order to avoid these failures, the users of steel should distinctly indicate to the makers that they required it for welding purposes, as there was a very great difference in the quality of steel manufactured specially for welding and that for ordinary constructive purposes. There was also to be observed a distinct difference in the manner of welding. In South Staffordshire they had as good smiths as were to be found anywhere in the world, but it frequently happened that failures of steel when used for welding purposes could be traced to defective workmanship and not to the segregation referred to by the president. They could not maintain the structural trades of the district unless they had good and cheap steel; and whilst it was necessary that manufacturers of steel should realise the importance of making it thoroughly reliable, it was also necessary that users should clearly specify what they required it for, and also that the smiths should take great care in manipulating it during the processes of welding. It was quite true that steel when exposed more readily oxidised than wrought-iron, but so far as the Forth Bridge was concerned, he believed that as much paint would have been required if it had been constructed of the latter metal.

NEW THEATRE, WAKEFIELD.

A NEW building, which is to be known as the Royal Opera House, has been erected on the site of the old Theatre Royal, in Westgate, Wakefield. It has been erected from plans prepared by Mr. Frank Matcham, of London. The various works are on the point of completion, and it had been announced that the new theatre would be opened on Monday last. The opening day has been deferred, however, by the general purposes committee of the West Riding County Council for three weeks. Mr. Sherwood, the owner, applied at the adjourned Brewster Sessions for the city for the renewal of the Excise license he held in connection with the old theatre, and the application was adjourned. An application was also made to the general purposes committee of the West Riding County Council sitting

at Wakefield Town Hall, for a license to perform stage plays in the new building. It was said that the new building was a great credit to Wakefield and also to Mr. Sherwood, who had shown much enterprise, and unless a theatrical license was granted the expenditure would be in a very great measure thrown away. Discussion took place on the application, and it was evident that some of the committee appeared opposed to intoxicating liquors being sold in the new theatre, although Mr. Sherwood held an Excise license for the old theatre. There was also a feeling on the part of many of the committee that it would be unsafe to open the theatre, as the plastering and other work has only just been completed. It was explained that the plasterwork had been stoved and dried in London prior to being sent to Wakefield for fixing, and that artificial heat had been in constant use by day and night for some time. After the committee had consulted in private for some time they granted the license on condition that the theatre is not opened for three weeks.

THIRLMERE WATERWORKS ARBITRATION.

THE evidence for Lord Lonsdale in the arbitration between his lordship and the Manchester Corporation has been concluded. The case, which is being heard by Mr. C. Oakley as arbitrator, arises out of claims on account of wayleave for the conduits, stone employed and injury to the property. Two sums of 7,160*l.* and 5,760*l.* are in question.

Mr. Bintley, surveyor of Kendal, gave evidence about the manner in which he calculated the sums claimed.

In cross-examination he said that the calculations he had made were based upon the assumption that all the stone taken in the course of the construction of the aqueduct was the property of the Earl of Lonsdale. He made out that the total quantity of rock and material used by the Corporation for concrete was 66,581 cubic yards, and the quantity used for building purposes was 1,796 yards. These figures were the result of his measurements of the works, and were not the result of measuring or weighing of the material as it was used. The figures he had given related to the manorial claim. With regard to the properties affected by the notice to treat, the total amount of rock used in the works on those properties was 16,799 cubic yards for concrete and 295 cubic yards for building. He was not aware that the original claim under the manorial claim was with respect to twenty-three miles, nor did he know how much had been struck out, but he understood that the total now was for eighteen miles. Witness first made a valuation about a year ago, and that valuation was more than 5,760*l.*, the amount of the present manorial claim. He was not aware that a year ago Lord Lonsdale made a claim with regard to twenty-three miles, which amounted to a total of 4,500*l.* He thought it was since that claim was made that witness had added to the manorial claim the sum of 1,800*l.* for wayleave. He had made that addition within the last few days, after a general discussion among Lord Lonsdale's advisers. Witness certainly thought that without that 1,800*l.* the amount claimed was not sufficient. Deducting the 1,800*l.* from the amount of the present claim, there remained 3,960*l.* for the minerals over eighteen miles, which was about the same as 4,500*l.* for twenty-three miles. He believed it was true that there was no mention of wayleave or easement in the original claim. He could not say who first made the suggestion that 1,800*l.* should be added for wayleave. He had not considered that there was any part of the course of the aqueduct where it passed through solid soil where there were no minerals. But if there were such portions, he considered that Lord Lonsdale owned whatever was beneath the surface, whether minerals or soil. Witness had on more than one occasion collected royalties for Lord Lonsdale for stone taken out of the ground, apart from slate. In the cases where slate was got the stone which was taken out in the process of slate-getting generally went to spoil as of no value. But thousands of yards of stone had been sold at prices ranging from 3*d.* to 2*s.* per cubic yard, according to the nature of the stone. At Spital 4*d.* to 6*d.* per yard was paid by the County Council for stone unquarried for road-stone, and at other places 6*d.* and upwards was paid. He did not think that any of the stone taken out of the Manchester Waterworks tunnels had been used for road purposes. He was not aware that one of the contractors undertook to keep the roads in repair with this stone, and that the experiment was not satisfactory. If that had been done, it was before the roads came under the control of the County Council. It was true that in some cases where 2*s.* to 3*s.* per yard was paid for road-stone it was for stone collected by the farmers from their fields and brought to the roadside, and the cost of haulage was included in the cost. The embankment made in the Spital property by the works formed part of the field, and was not in any way fenced. The total height of the embankment was about 10 feet. He had put down as damage for the embankment 3*s.* per running yard. Where the aqueduct was carried in pipes under the ground he had charged 2*s.* per yard. He certainly considered that the land was seriously injured by

the laying of the pipes, and would be worse for purposes of cultivation for fifty years to come. Even if there was 2 feet 6 inches of soil above the pipes and the work had been properly executed, he did not think that the land would be as good for farming purposes. He considered that the rental value of the Spital Farm was considerably reduced as the result of the waterworks. He did not know of any place on Lord Lonsdale's estates where people were allowed to take stone without payment. He considered that when land was covered by spoil it was of very little value, but he was not prepared to say that he would charge quite the full value of the land when it was used for spoil purposes. He was not aware that in any case the full value of the land had been claimed. He was not aware that in some instances where the full value of the land was 50*l.* per acre, 80*l.* per acre had been claimed for injury to the land from putting the spoil on it. He did not know what was the value of the land used for spoil. In estimating the damage from the placing of air-valves he had charged not only for the one that had already been placed in the land, but for the four others that would eventually be placed there. So far as he knew, the Manchester Corporation might exercise their rights to place the remaining air-valves to-morrow. Wherever the aqueduct was "cut and cover" or tunnel all the air-valves were already put in; it was only where pipes were used that the air-valves remained to be put in in the future.

Re-examined: Even supposing the value of the whole farm was 50*l.* per acre, it was not likely that Lord Lonsdale would sell the five separate small pieces of land in the best part of the farm which had been used for spoil beds at anything like 50*l.* per acre. With regard to the quantity of stone used for the concrete, he had made his calculation with great care after spending some three weeks in measuring and inspecting the work. His calculation was based on the concrete having an average thickness of 18 inches, but there were many places where the thickness was 3 feet. As to the value of the stone taken out of the tunnels, he considered that it was quite worth 1*s.* per cubic yard for the purpose for which it was used by the Manchester Corporation. So far as Dunmail Raise was concerned, where the tunnel was some 260 feet below the surface, he considered that the whole hill was worth 2*d.* per cubic yard, and he did not think Lord Lonsdale would sell it for less.

Mr. Balfour Browne: I fancy Lord Lonsdale's successor would be a poor man if he had to pay death duties on any such basis.

Witness in further re-examination said that there were many stone quarries on Lord Lonsdale's estate, and of course the stone taken from the quarries was all paid for. If the Manchester Corporation had not found this stone on the site of their works they would have had to buy it from someone and would have been put to great cost for cartage as well. He did not see, therefore, why they should have the material for nothing because it happened to be on the site of the works. He knew as a fact that the stone from one of the spoil banks on the land of Mr. Dunlop was now being sold at 4*d.* per cubic yard or 2*d.* per yard more than Lord Lonsdale was claiming from the Corporation for stone placed on the spoil banks.

Mr. James Hudson, land agent, Penrith, said that he was land agent to the Lonsdale estates. He had had considerable experience in the valuation of land and of wayleaves in Cumberland and Westmorland. He had made a careful survey of the waterworks as they passed through the Lonsdale estates and an estimate of the value of the easement. He valued the easement in the case of the tunnel at 4½*d.* per lineal yard, and in the case of the "cut and cover" at 9*d.* per yard, because the surface was disturbed, and he calculated the sum at the rate of twenty-five years' purchase. He had also valued the stone used for concrete and building purposes at 1*s.* per cubic yard, and the stone put on the spoil banks at 2*d.* per yard. With regard to the Spital Farm property, he certainly considered that it had a value as prospective building land, and the carrying of the aqueduct through the property had the effect of seriously depreciating the value of the property for building purposes. He therefore valued the easement through this property at 2*s.* per lineal yard. In the case of the Hulton Roof Farm he valued the easement at 1*s.* per yard because it reduced the letting value of the property for farming purposes. He considered that 80*l.* per acre was a fair charge for the use of the land as spoil banks. The total of his valuation for the properties under the notice to treat was 7,149*l.* As to the manorial claim, his valuation agreed in the main with that of Mr. Bintley. He estimated the value of the stone used at 1*s.* per yard and the stone put on the spoil banks at 2*d.* per yard. The total for minerals was 3,943*l.* He also considered that Lord Lonsdale as owner of the minerals in these manorial properties was entitled to some payment for the disturbance of the minerals, and he thought 100*l.* per mile was a reasonable price under this head. This made the total amount under the manorial claim 5,743*l.*, and the total under both claims 12,893*l.* His experience of wayleaves had been that for minerals the charge was usually per ton, and for water the charge was generally so much per yard run. In this case the charge of

100*l.* per mile represented 1*s.* 2*d.* per yard, and he thought that was a mere acknowledgment, and the charge could not well be less.

Cross-examined by Mr. Balfour Browne: He did not consider that the proper measure of the value of the wayleave was the actual damage to the property. Of course in the case of a tunnel 250 feet under the surface it was not possible to say that there was any actual damage to the land. In the case of "cut and cover," however, where the surface of the land was disturbed there was a permanent deterioration in the value of the property, even though the soil was replaced and the work properly done. It would take a great number of years for the land to resume its natural state. He had had experience of this deterioration in the value of the land in the case of the Hulton Roof Farm. Previous to last year the rental of that farm of 38½ acres was 336*l.* 12*s.* per annum, but they had been unable to get more than 280*l.* per annum on the lease falling in last year. No doubt there had been a reduction in the value of land generally, but there had been no case on the Lonsdale estates where there had been so heavy a reduction as in the case of Hulton Roof Farm. Besides, the tenant distinctly said that the farm had been deteriorated in value from the aqueduct being carried through it. As to the value of the stone, witness was aware that in 1876 he was arbitrator in a case in which the parish authorities had quarried stone for building purposes without permission, and witness awarded a sum of 27*l.* 1*s.* to the owner of the stone, that figure working out at about threepence per cartload for the quantity taken.

Re-examined: That would mean about 8*d.* per cubic yard, and the quarry from which the stone was taken at Lazenby was a considerable distance from the market. There was another instance at Lazenby, where the Midland Railway Company took a quantity of stone from land belonging to Sir R. Musgrave, and after litigation had to pay a large sum of money. He certainly considered that the carrying of this aqueduct through the property might seriously interfere with subsequent working of the minerals, and he had taken this into account in estimating the value of the wayleave.

In reply to the arbitrator, witness said that in most cases the lord of the manor had the right to enter and take the minerals whenever he liked, giving the tenant compensation. That right was expressly reserved in most of the enfranchisements, but in the case of some of the customary tenures it was a question whether the lord of the manor had the absolute right. Witness was not aware of any instance in which Lord Lonsdale had exercised this right.

Mr. John Holmes, architect and surveyor, Milnthorpe, said that he had a long experience in connection with the valuation of land in Cumberland and Westmorland, having the advantage also of being a member of the assessment committee for the county of Westmorland. He knew the properties which were the subject of the present inquiry, and had carefully gone over them and the waterworks with a view of estimating the effect of those works on the letting value of the properties and on the estate generally, and the figures he had arrived at were very nearly the same as those of the last two witnesses.

Mr. Balfour Browne said that he was prepared to admit the general accuracy of the figures as to the quantities of stone taken and the extent of the works, but of course he did not admit anything as to the prices on which the claim was made up.

The witness then gave the details of his calculations. He considered that the land over the cut and cover portions of the aqueduct was permanently deteriorated, and he maintained also that the prices of 1*s.* per cubic yard for the stone used and 2*d.* per yard for the stone put upon the spoil banks were moderate and fair. With regard to the Spital property, it was situated near to the town of Kendal, which at present was extending in its direction, and there was therefore a good prospect of the Spital property being required for building purposes within a short time. He had taken this fact into consideration in estimating the injury to that property, his figures being almost the same as those of the previous witnesses. With regard to the spoil banks at the Hulton Roof property, he agreed with the other witnesses in estimating the damage to the land at 80*l.* per acre. It was a very different question, taking five or six acres in the middle of a farm and using it for spoil purposes, to buying a piece of property as a whole. The spoil banks themselves would be almost valueless as land for cultivation for many years, and in all probability it would never be as good land as it was before the spoil was put there. With regard to the manorial claim, he agreed with the figures already given as to the value of the stone taken, and he also considered that 100*l.* per mile was a very reasonable sum to ask for the wayleave through this property, having regard to the fact that the property was not the absolute property of Lord Lonsdale, but that he had manorial rights only.

Cross-examined by Mr. Balfour Browne: His estimate made on Sept. 12 showed a total of 8,800*l.*, but it did not contain any charge for unused stone nor any mention of

wayleave through the manorial properties. With regard to his estimate of the value of the wayleave for the tunnel under the property at Dunmail Raise, he had not taken into account in estimating it the value of the land over the tunnel, and he had no idea what was the value per acre of that land. He had, however, reckoned the easement in the case of the tunnel at 4d. per yard, and in the case of the cut and cover at 8d. per yard. According to that, it would seem that the deterioration of the land in the case of the cut and cover as compared with the tunnel was equal to 20l. per acre per annum, but of course in that calculation he took into account the fact that the Corporation in the case of the cut and cover acquired a right of access to the surface of the ground.

Mr. Frederick Puncher, land agent and surveyor, Kirkby Lonsdale, said that he had been for twenty years resident agent for the Bective estates in Cumberland and Westmorland, and had great experience in the valuation of properties. In several instances he had acted as umpire or arbitrator in cases where claims for compensation were made against the Manchester Corporation in connection with the Thirlmere scheme. He knew well the properties of Lord Lonsdale through which the aqueduct passed, and had made a careful valuation of the charge that ought to be made for injury to the property by the works. With some small differences in detail, his calculation worked out at about the same total as that given by the previous witnesses.

Mr. George Storey, land agent to the Earl of Abingdon's Lancashire estates, gave his estimate of the injury to the property and of the value of the wayleave, his figures being practically the same as those given by the previous witnesses.

In cross-examination, the witness said in estimating the value of the stone he should take into consideration the purpose for which the stone was wanted as well as the quality of the stone. He was not aware that Westmorland and Cumberland stone was so bad that large quantities of stone were constantly being brought from Northumberland and elsewhere for building purposes. In re-examination he said that in estimating what should be paid for easement he had taken into consideration the fact that the Manchester Corporation had the right of access to the land for the purpose of repairing the aqueduct. This was a serious detriment to the property, and would reduce its rental value.

Mr. Thomas Fenwick, agent to Lord Cadogan's estates, supported the estimates already given of the value of the wayleave through Lord Lonsdale's property, and the value of

the stone and material taken from the ground. He had considered the question from the point of view of what would be the price as between a willing purchaser and a willing seller, and he had also taken into account the particular purpose for which the land was taken. Cross-examined: No doubt the result was that the amount was greater than the actual injury that was done to Lord Lonsdale's property. He agreed that in that part where the aqueduct was in tunnel the actual injury to the property would be very slight, and would be simply the probable interference with other mining operations. But he thought he was entitled to take into account the fact that there were other towns besides Manchester to which it would be a great advantage to obtain a supply of water from Thirlmere, and that this considerably increased the value of a wayleave beyond the actual injury done to the property. There was no other line by which pipes could be carried southwards except by passing through Lord Lonsdale's property, and he had regarded this as one element in fixing the value of the wayleave.

Re-examined: He certainly thought that besides paying for the right of going through the land the Corporation ought also to pay for the material they took out of the tunnel, when that material was a valuable mineral. For instance, if they had come across a valuable bed of coal and had taken out a few thousand tons he certainly thought they ought to have paid for it. His estimate of the value of the wayleave might have been made on the basis of including everything—the minerals taken out as well—but he had not made his calculation on that basis. If it had turned out that the material extracted was of no value, he should not have considered that the Corporation ought to pay anything, but the stone had been of great value to them. If they had had to bring the material from outside it would have cost them 5s a cubic yard, instead of 1s a yard which they had been charged by Lord Lonsdale. He did not know as a fact that there were other valuable minerals in Dunmail Raise, the working of which would be interfered with by the carrying through of the tunnel, but he had considered that there was a possibility of that being the case and that had formed another element in his calculation.

Mr. Richard Hassard, civil engineer, said he had had great experience in waterworks engineering. He had an intimate acquaintance with the Lake District, and was the originator some years ago of a scheme for providing London and other large towns with a water supply from the Lakes—principally Thirlmere and Ulleswater. The aqueduct would of necessity have had to pass through Lord Lonsdale's property. If Man-

VOLUME II. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered

Price 12s. 6d.

Office: 175 Strand, London, W.C.

chester had not prepared the Thirlmere scheme a similar scheme might with great advantage have been framed by a syndicate of other manufacturing towns in Lancashire and Yorkshire, in which case also the line of aqueduct would have had to come through Lord Lonsdale's estate. As to the principle on which payment should be made for wayleave in cases of this kind, he thought that the value of that wayleave to the persons acquiring it ought to be taken into consideration in fixing the compensation paid to owners of private property.

Cross-examined: The estimated cost of the scheme which he had described was 18,000,000 $\frac{1}{2}$, which was not more for the London of to-day than was the cost of the New River scheme for the London of the time when that scheme was carried into effect. Witness had not been called as a witness against the Manchester Thirlmere scheme, and had never condemned it; in fact, he always considered it a fine scheme. He considered, however, that the Manchester scheme could not get any more than 50,000,000 gallons per day; that was the limit of the water that could be got by it. If they banked up Thirlmere Lake 15 or 20 feet higher than they had done they would not get any more water. He had not gone into the question of the cost of the Thirlmere scheme to Manchester, but he understood it was a very advantageous scheme for Manchester. He was not aware that for the smaller supply of 10,000,000 gallons per day, as at present, the cost to Manchester was something like 6s. 8d. per 1,000 gallons; but, if it were so, he supposed Manchester would charge 10s. per 1,000. He was aware that the average cost of water in the North of England and the Midlands was 6d. to 1s. per 1,000 gallons. He knew that Liverpool and Birmingham had since the date of his scheme gone to Wales for their water supply. He did not know that there was any large town in Lancashire that was without good water supply, but there was a very different state of affairs at the date of his scheme, 1869. He was aware that there was a clause in the Manchester Bill which empowered other towns on the line of supply to obtain water from the Manchester aqueduct after Manchester had taken enough for itself.

Re-examined: Many of the large towns of Lancashire had been to Parliament with waterworks schemes since 1869. He considered that the engineer of the Thirlmere scheme had adopted the best route for the aqueduct; practically there could be no deviation of importance, and the line must in any event have passed through Lord Lonsdale's estate.

Mr. William Grisenthwaite, builder and contractor, said that he had carried out large contracts for buildings and water-

works in Cumberland and Westmorland. He had tendered for the construction of the embankment at Thirlmere and for one of the tunnels for the aqueduct. He was therefore well acquainted with work of that kind. He had gone over the works passing through Lord Lonsdale's estate, and he agreed that the estimate of 1s. per yard for the stone used in the concrete was a fair figure, that price being the price per cubic yard when made up in the concrete, deducting one-sixth for the cement. He also thought 1s. per cubic yard for the stone used for building was a fair price. He said this as the result of his own experience in buying and selling stone of a similar kind. As to the stone thrown on the spoil-banks, as that had not the same commercial value he considered 2d. per cubic yard was a proper price.

Cross-examined: He had built houses out of the very same kind of stone as that taken out of the tunnels by the Manchester Corporation, but in some cases the facing stone for houses that he had built was brought from a distance. He had not used stone taken from a great depth for building purposes, but he did not know that such stone was of very inferior quality and could not be worked. There was an unlimited quantity of this kind of stone in the district. He had paid as much as 5s. a cartload for stone of this kind for building purposes, but that price included the cost of quarrying and cartage for four miles. He had known instances where the waste from the quarries had been sold, when it happened that there was a market for it. He had himself rented a quarry at Lake Side and had got good building stone from it. He had bought stone for making concrete and had paid 1s. per yard for it. He had known this stone used for road-making and he knew that some portions of it would go to mush after frost if there were any heavy traffic. Other portions were good for road-making; the quality of the stone varied considerably. He had been about the district all the time the work was going on, and he had seen the stone many times as it was brought out of the tunnels, and he knew that it was mostly good stone.

Re-examined: So far as he could see, all of the stone that came out of the tunnels was good enough for making concrete, and some of it was good enough for building purposes. There were certain free quarries on the estate to which anyone living on the estate could go and take stone without payment, but strangers from other parts would not be allowed to take stone. Witness had bought stone from Mr. Jackson, one of Lord Lonsdale's tenants who had a quarry, and had paid 5s. a cartload, including haulage, equal to 10s. per cubic yard.

By the Arbitrator: The actual cost of quarrying the stone would be about 1s. per cartload, or 2s. per cubic yard.

Mr. John Norman Dickinson, land agent and surveyor, said that he had considerable experience in settling wayleaves for water pipes in various districts of Cumberland and Westmorland. In settling the amount to be paid for wayleave he took into account not only the damage to the surface of the property, but the value of the wayleave to the person to whom it was granted. Adopting that principle, he had considered the figures that had been given by previous witnesses. He had taken the capacity of the aqueduct, and according to his experience in other cases he believed the claim made for wayleave was a reasonable one.

Cross-examined: He had taken the capacity of the water pipes and had compared it with 15-inch pipes that he had dealt with in cases that had come within his experience, and he had estimated the charge for easement accordingly. He did not look at the question merely as one of damage to the property, but also as to the advantage that accrued from the person who had the wayleave. Suppose the case where a company or a person having the wayleave for a 15-inch pipe should make a profit of 10 per cent. and the company or person with a much larger pipe made a loss; how, then, would you estimate the payment for the wayleave?—Witness: I could not know whether a profit or a loss would be made until the pipes were laid and the works completed. But take the case where the arbitration took place long after the pipes were laid, as in the present case, and suppose it was known that the profit was made in the one case and the loss in the other, how would you estimate the payment for the wayleave?—I do not know. Take another case where a large number of small pipes were carried through with less capacity than one large pipe, but occupying far greater space. Would not your principle of relative capacity break down?—I don't know that it would.

Re-examined: Witness naturally concluded that the Manchester Corporation in carrying out this scheme had an idea that it would be a benefit to them, and that they were not undertaking the work for the fun of the thing. He understood also that the question to be decided related to the date when the pipes were laid and the wayleave taken, when it was not possible for anyone to say whether there would be a profit or a loss from the works.

By the Arbitrator: The wayleave for the 15-inch pipe to which he had referred was valued at 1d. per yard per annum, or at twenty-five years' purchase 2s. 1d. Witness had actually

paid that price for such a wayleave in the case of several local boards.

This concluded the case for the claimant, and the inquiry was adjourned to November 1, when the case of the Manchester Corporation will be commenced.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 18105. Charles Reid, for "Improved safety window."
- 18117. Frederick Garon, senr., for "Jointing lead or soft-met 1 pipes and other plumbers' pipes."
- 18126. Joseph Hall, for "Improvements in jointing stone-ware and other pipes, and in moulds for making the joints."
- 18178. Alfred Richard Fairer, for "An improved fastener for windows."
- 18210. Graham Sarjeant Cory, for "An improved composition for roads, pavements and floors."
- 18251. William Ingram and Benjamin Langton, for "Improvements in machines for making sanitary pipes."
- 18334. Joseph Wharfe, for "Window lock."
- 18404. Theodor Schröder, for "Improvements in chimney-cowls."
- 18471. David Mitchell, for "Improved syphon-action for flushing water-closets."
- 18476. Thomas Black, for "Improved means for opening window sashes inwards."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

A NOVEL project it is said is on foot by which the waters of the river Kent shall be applied to the purposes of a new railway in the Lake district. It is proposed to construct an electric tram line from the Furness district to Bowness, with an auxiliary undertaking of eventually carrying it on to Ambleside. A meeting has been held at Cartmel with reference to the scheme, and water rights have already been secured in order that the electric current may be generated from turbine power.

VARIETIES.

WE hear that Messrs. Cassell & Co. have arranged with the authorities of the Manchester City Art Gallery for the exhibition during the first week in November of the original drawings executed for their new art work, "Manchester Old and New."

A FIRE has taken place at Trinity College, Glenalmond, twelve miles from Perth. It originated near the great tower. The damage is estimated at 2,000*l*.

IN Dundee, on Monday night, a fire broke out in premises occupied as a cooperage and timber store. The building and its contents were totally destroyed, the loss amounting to between 5,000*l*. and 3,000*l*.

THE general meeting of the Edinburgh Association of Science and Arts was held on Monday night in the Scottish National Portrait Gallery, Queen Street, the hon. president, Sir R. Murdoch Smith, occupying the chair. The secretary's report on the past session, which was submitted, referred to the increased prosperity of the Association, and stated that the number of members had largely increased during the year, ninety-eight having been enrolled; the treasurer stated that there was a balance of 58*l*. 15*s*. 1*d*. at the credit of the Association.

THE general purposes committee of Crewe Town Council have decided to give 800*l*. for a site of land in Richard Moon Street, whereon to erect an art school costing about 5,000*l*. An agreement was also made to acquire five acres of land at Copenhall, to erect an isolation hospital costing probably about the same sum.

AT a meeting of the Wexford Corporation, Professor D. E. McCarthy, M.E., was appointed borough surveyor and inspector of waterworks in place of the late Mr. E. K. Ryan, C.E. There were, the *Irish Times* says, no less than seven candidates for the positions, the salary of both of which amounts to only 80*l*. per annum.

THE Association for the Promotion of Art and Music in the city of Glasgow have received from the executive committee a report from the master of works on the progress of the art Galleries in Kelvingrove. The portion of the work to the west of the central block may, with reference to the basement contract, be said to be completed with the exception of the steel girders and joists and glazed facing bricks required. In the central and eastern blocks the brickwork is in many portions approaching the basement floor level. Owing to the

coal strike, however, the supply of bricks has been to some extent deficient, and some portions of the work have been delayed in consequence.

THE opening meeting of the Manchester Association of Engineers has just been held. Members to the number of 150 visited the Manchester Corporation Hydraulic Station in Gloucester Street and the electric works in Dickinson Street. They were conducted by Mr. F. M. Evanson, engineer, over the hydraulic station, and over the electric works by Mr. C. H. Worthingham, engineer.

LOCAL demands and structural exigencies having rendered desirable the enlargement of Croydon General Hospital, the foundation-stone of the new wing of which was laid, the *Croydon Advertiser* says, by the Duke of Edinburgh during the mayoralty of Mr. Jabez Balfour, of Liberator notoriety, on Saturday last the Archbishop of Canterbury opened a new wing of two wards containing forty beds, with kitchens and stores on the top storey. The new building has been constructed by Mr. Samuel Page, of Croydon, everything internally is of the newest design and constructed upon the most approved modern hygienic principles, and all the fittings have been supplied by local tradesmen.

ADDITIONS have been made to the church of St. Michael Camden Town, of chancel, south aisle and chapel. The edifice was erected from the designs of Messrs. Bodley & Garner, architects, London, the builders being Messrs. Stephens & Bastow, of Bristol, with the assistance of their foreman, Mr. Hampton.

SERPENTINE, admirably adapted for industrial purposes, and of an oil-green colour, semi-transparent, is, Mr. John Plummer, of Sydney, writes, found on the Murrumbidgee, at Bingera, county of Murchison; Warialda, county of Burnett; Barraba, Manilla, county of Darling, and Stony Batta, county of Hardinge. Different varieties of red-veined serpentine, steatite and other similar minerals are reported in the Upper Peel River. It also occurs at Coolac and Jones's Creek, near Gundagai, county of Clarendon, and on the Clarence River. A foliated variety of serpentine occurs on the Murrumbidgee, of a yellowish colour, associated with a dull red and green serpentine rock, and at Cowabee, forty miles from Wagga Wagga, with leaf gold. A fibrous variety of serpentine is found at Kelly's Creek, Gwydir River, and in the serpentine at Bingera, county Murchison, with meerschaum. It occurs also as a green striated mineral at Lucknow, county Wellington, and Wentworth, near Orange, county Bathurst.

TRADE NOTES.

THE Yöst typewriter has been awarded a gold medal at the Lyons Exposition, one of the most important exhibitions held in France this year. This has been immediately followed by the award of the gold medal to the same machine at the British and Colonial Exhibition at Manchester. The Yöst record is now seven gold medals, with highest honours on every occasion.

THE new Church schools, Gosport, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A VERY fine new clock has just been fixed in the parish church of Newland, Gloucestershire, which strikes the hours, chimes the quarters, and shows time on a 6-feet dial. The whole of the work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby, who made the clock for St. Paul's Cathedral.

THE Edinburgh School Board have accepted tenders for the enlargement of the Royal High School, Canonmills, Leith Walk, and Regent Road schools—the probable total cost being 8,200*l.* for the High School, 750*l.* for Canonmills, 1,800*l.* for Leith Walk, and 1,000*l.* for Regent Road.

THE LATE J. H. OSBORNE, C.E.

THE death is announced at his residence, Summerseat, near Philadelphia, of Mr. John Humfrey Osborne, who has been a prominent civil engineer in the United States for over half a century. He was born in Dublin, September 30, 1818. On leaving school he travelled widely, visiting Australia among other countries. In 1839 he went to the United States and became confidential secretary to Mr. Wirt Robinson, chief engineer of the Philadelphia and Reading Railroad. From that time he threw himself ardently into the profession of engineering, and rose to be chief assistant in 1843. Three years later he was appointed chief engineer of the Philadelphia and Reading Railway, but resigned that position later on to join with his brother, Mr. R. B. Osborne, in the construction of the Waterford and Limerick Railway. Returning to the United States in 1850, he was appointed to the Ogdensburg and Lake Champlain Railway, and the next year took charge of a portion of the construction of the Southside Railway in Virginia. From 1852-53 he was superintendent of the

Richmond and Danville Railway, and on resigning that post to become associate chief engineer and superintendent of construction of the Camden and Atlantic Railway, was presented with a massive service of plate as a mark of the affection and esteem in which he was held. After the opening of the Camden and Atlantic Railway in 1854, Mr. Osborne became its general superintendent, but resigned his post four years later, to take charge of the construction of the most difficult section of the Lebanon Valley Railway through the counties of Berks and Lebanon, Pennsylvania. In spite of great difficulties Mr. Osborne completed this work to the day, and publicly received the congratulations and thanks of the president and board of directors. In 1858 he also rebuilt the Quakake Railway, uniting the Lehigh Valley, Black Creek branch, with the Catavissa Railway above Tamaqua, and with his brother, Mr. R. B. Osborne, made a survey for the continuance of this line into the Mahanoy coalfields. In 1873 he also undertook with Mr. R. B. Osborne an extensive barometrical survey for the Shenandoah Valley and Ohio Railway from Harrisonburg, Virginia, over the Great Northern and intervening mountains, crossing the Alleghanies into the valley at the head waters of the Greenbriar River. Mr. Osborne continued from time to time to take an active part in his profession, to which he was much devoted; but for the past twenty years practically lived in retirement at his country place, Summerseat, between Philadelphia and New York—one of the oldest and most interesting residences in the United States. Mr. Osborne was a civil engineer of great executive power, administrative ability and indomitable energy. Though a strict disciplinarian, he won the respect and strong attachment of his colleagues and all who served under him, which the many memorials and souvenirs presented to him testify.

MR. ARTHUR V. RUTTY, for the executrix of the late Geo. G. Rutty, writes us as follows:—I have the pleasure of informing you that the Corporation of West Ham have made a trial of my Improved Patent McAdam Road Scarifier on the Barking Road with very satisfactory results. Drawn by an ordinary 10-ton steam roller, 400 to 500 yards per hour are effectually scarified. The local authorities at Epsom, Ilford, Hendon and Dublin are now regularly working the machine with their own rollers. I have just completed the road in Hyde and St. James's Parks, 130,000 yards super, under contract for H.M. Office of Works.

WINTER, WARMTH & COMFORT.

HEATING AND VENTILATING APPARATUS.

GRUNDY'S SPECIALTY. PURE WARM AIR
UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR, as Supplied to

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouse Factories, Workhouses, &c.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

PROFESSOR TYNDALL writes:—

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus enabled to spend my winters in England instead of on a foreign shore,—Yours very truly,

October 24, 1893: Hind Head House, Haslemere.

JOHN TYNDALL.

Dr. GRIEVES says:—

I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. should not like my house warmed with any other method, for I like plenty of ventilation and do not approve of stagnant air.

Buckhurst Manor, Wadhurst.

THE "THOMAS" REGENERATIVE GAS LAMP.

MESSRS. W. M. STILL & CO., of 24, Charles Street, Hatton Garden, E.C., have recently been appointed the sole manufacturers of the "Thomas" patent gas lamps, and the facilities at their disposal should certainly insure excellence of material and finish with prompt execution of orders, for metal spinning in every department has been their specialty for many years, and large premises resounding with the hum of machinery attest the fact that they are doing a considerable business. Every detail of work in connection with the "Thomas" lamp will be of English manufacture and in experienced hands, an important feature when it is remembered that so many so-called regenerative lamps are defective in mechanical parts, and continually getting out of order. The "Thomas" lamp claims, in fact, to be an improvement in existing lamps, in that it is simpler in construction and so less liable to get out of repair. Professor Lambert, M.A., of the Royal Naval College, Greenwich, S.E., instances his using a "Thomas" regenerative lamp for 400 days of four hours per day, and the burner required cleaning out once only. The burners possess no intricate parts or fine perforated metal or gauze, a frequent cause of imperfect combustion on account of dirt clogging the action of the burner. It is also claimed that the flame being placed below the reflector considerably increases the illuminating power and economises the consumption of gas. It cannot be objected that only one pattern is supplied to meet all purposes, for the "Thomas" lamp is adapted to cover the whole range of

lighting. They have, for instance, a special design for warehouses, restaurants, public buildings, &c., in the "Thomas" patent globe lamp, the shape of which insures a ceiling and downward light, and is also more ornamental. The globe lights up a space of 40 feet square. Drawing and dining-room lamps are also in evidence in fancy Doulton-ware casings and fancy etched shades, and are claimed to be less costly than ordinary chandeliers with open burners. Ventilating lamps for billiard-tables, &c.; high power windproof lamps for outside shop-lighting are amongst other specialties. For some years a special feature has been made of railway platform lighting, and the principle has been largely adopted on the Metropolitan Railway at Gower Street, Baker Street, Portland Road and Bishopsgate Stations with uniform success, an experience which led to their being specified at the new station at Moor-gate Street, now in course of construction. With such credentials the "Thomas" patent gas lamps should increase in popularity, and be recommended in every case where efficient and economical lighting is the desideratum.

IMPROVEMENTS AT THE HOUSES OF PARLIAMENT.

A SERIES of alterations, involving a total expenditure of 14,000*l.*, has, says the *Times*, during the recess been in active progress within the Houses of Parliament, no fewer than 240 men being engaged upon the work. The scheme is almost entirely embraced by the recommendations of the select committee of the House of Commons which sat last session under the presidency of Mr. Herbert Gladstone, and the changes to be carried out mainly affect the accommodation of members and of representatives of the Press in the House of Commons. It will be remembered that the committee, after considerable discussion, resolved that it was undesirable to build a new House of Commons or to enlarge the existing chamber; and, having regard to previous inquiries on the subject, as well as to the late period of the session at which they assembled, the committee refrained from taking evidence concerning the general ventilation of the House. One of the principal recommendations contained in the report of the committee aimed at an enlargement of the kitchen accommodation, which has been exceedingly unsatisfactory, and

CARVED OAK AND ANTIQUE DEPARTMENT, No. 204 TOTTENHAM COURT ROAD.

an addition to the space available for the purpose is now being made by extending the ground floor at the point into the Commons inner court. A servants' hall will there be provided, together with manager's-room, cigar and wine stores, and a waiters' dressing-room. New wine despatch cellars will take the place of the old lift-room, and a new staircase for the use of the staff will ascend from the kitchen to the dining-room floor. An excellent kitchen 40 feet long is being constructed by the absorption of the room previously occupied by Dr. Percy, and the ceiling is covered with cement to prevent the possibility of any smell ascending. Immediately adjoining the kitchen will be the lower service-room, from which four hydraulic lifts will rise to the level of the members' dining-rooms. At the opposite end of the kitchen will be a pastry-room and a separate room for the chef. The cooking appliances will at the same time be improved, and it is hoped that the general result will be to make the dining arrangements for members much better than they have been hitherto.

The members' principal dining-room, which is one of the finest apartments in the palace, is being restored to its original beauty, much of which has been hidden by successive alterations and encroachments. The ungainly projection formed by the old wine-bar has been removed, and in future the wine will be so served from a similar room under the groined arch seen from the lower waiting-hall. The grill—an exceptionally fine piece of ironwork—has also been taken down and re-erected in a large general service-room, located between the large dining-room and a new dining-room secured by the conversion of the old smoking-room. All the four lifts will enter the general service-room, and the apartment is being fitted with hot closets and all the conveniences incidental to efficient dining arrangements. No structural alteration will be made in the dining-room reserved for Ministers, but double window-frames are being affixed in each of the three dining-rooms, and the entire suite will be redecorated, the effect of which work will be to show the fine oak panelling in the members' large room to the fullest advantage. Committee-room E, hitherto used by the grand committee on law, is to take the place of the smoking-room thus appropriated for dining, and the standing committee will be transferred to the spacious chamber in the north-west corner of Westminster Hall, first used for the sittings of the Royal Commission on Labour. When not required for committee purposes, this room will be made available for the private secretaries of members of Parliament. By concession on the part of the Lord Great

Chamberlain and Lord Morley, two of the Railway Commissioners' rooms are in future to be at the service of members for deputations or conferences, one of the present conference-rooms being devoted to type-writing. The octagon-room will also be used for small private conferences or meetings.

Alterations calculated to add materially to the comfort of members are also being carried out at the foot of the staircase leading from the committee corridor to the reading-room and to Ministers' private rooms. The two small dining-rooms which there existed have been abandoned, and the space will be set apart to provide dressing-room accommodation and a hair-dressing saloon. There will be seven cubicles, so that members may dress for dinner without going to their town residences or to clubs. As a further convenience, baths are for the first time being introduced. The old bakehouse has been utilised, and four private baths are being erected in rooms of the most approved type. Equivalent dining accommodation for members who desire to introduce strangers will be provided by the conversion of two of the Ministers' rooms adjoining the main terrace dining-rooms and of the terrace reading-room, with the result that there will be a net gain of thirty seats by the new arrangement. Among other structural changes will be a slight enlargement of the post-office in the members' lobby, which will give, under the staircase leading to the peers' gallery in the House of Commons, a certain amount of additional window space.

Visitors to the chamber will welcome the announcement that when they sit underneath the gallery it will no longer be necessary for them, as in the past, to vacate their places every time a division is challenged. Hence the familiar order given from the chair, "Strangers will withdraw," will no longer be heard. The public admitted to the seats below the gallery will retain their places during divisions, and a light handrail will prevent the possibility of any intrusion upon the precincts of the House. Electrical communication will be established between the chamber, the library and the smoking-rooms, and the division bells will be extended to the grand committee-room in Westminster Hall.

The improvements in connection with the Press gallery include the construction of two new entrances in place of the one formerly existing in the centre, which will now be closed; the enlargement of the kitchen by the absorption of the tea-room, the acquisition as a new tea and reading-room of that formerly occupied by Colonel Legge, the assistant serjeant-at-arms, and the construction of a "copy" carrier from the

gallery to the junior messengers' room in the Star Chamber. The chaplain's room has been set apart for the members of the *Times* staff, accommodation being found for Archdeacon Farrar in one of the rooms originally intended for Ministers. It is not expected that Parliament will be summoned to meet before the end of January or the first week in February, and by that time the whole of the alterations described, forming the largest scheme undertaken at the Palace of Westminster in recent years, will have been completed. The work is being carried out under the direction of Mr. John Taylor, the chief surveyor of Her Majesty's Office of Works, with the assistance of Mr. Jones, the clerk of the works, and Mr. Prim, the resident engineer.

THE DYKE CABLE-WAY AT BRIGHTON.

THE opening ceremony took place on Saturday in connection with the new cable-way across the "Devil's Dyke," the well-known resort some five miles inland and uphill from Hove, whence such extensive and beautiful views are obtainable. The Dyke itself, says the *Standard*, is one of the deepest and steepest of the many combs into which the geological chalk tracts are always more or less cut up by natural causes. The heights referred to have long been seized upon by "trippers" and pleasure-seekers, and the paraphernalia of a standing fair are more in evidence now than the Roman fortifications which are popularly supposed to have existed there in former days. The distance across the valley from summit to summit is over fifteen hundred feet, and the depth below the level of the new cable-way is 230 feet perpendicular. This work is a practical demonstration of the suitability and capacity of this particular system for doing pioneer transport duty under circumstances in which the ordinary railway could not possibly be remunerative. Switchbacks, gigantic wheels, high towers, water-chutes and other sources of sensation have proved popular and profitable, and the new experience of travelling in a cage suspended from a rope in mid-air may be expected to form a remunerative addition to the attractions of the Dyke, especially as the capital outlay on this cable-way, with all the incidental expenses of a first essay, was under two thousand pounds. On Saturday the Mayor of Brighton (Dr. Ewart) and Mayoress, Mr. William Spink, the chairman of the Telfer Cable and Cliff Syndicate, and the inventor, Mr. Brewer, at one o'clock precisely, opened the undertaking for public use by making a journey across from side to side. There have been numerous examples of

telfer lines in single rope, double rope, and electrical haulage for minerals, but we do not recall any really convenient and suitable application of the system to passenger conveyance. The Mayor's journey, and the others made during the next three hours by the numerous visitors at least are evidence that in this case the result is successful. The Syndicate have employed as contractors Messrs. Heenan & Froude, the constructors of the Blackpool Tower, who are now engaged in erecting the still loftier one at Wembley Park. They have further obtained certificates of the safety of the line and its fulfilment of the requisite conditions of service from Mr. Eric Scott Russell and Mr. Molesworth, members of the Institute of Civil Engineers.

The Dyke cable-way is undoubtedly a novelty in engineering. It is constructed of the lightest and strongest materials—steel wire-rope and angle-iron. It is very simple in its detail and in its working. The primary support of the suspended track is a steel-wire cable, which is carried 1,200 feet from side to side of the valley over two lofty columns, formed of angle-iron rivetted, erected at some distance down the slopes of the banks. The ends of this catenary cable are anchored into the solid chalk, near the summits of the valley crests. Screws of steel 10 feet in length are provided for putting the requisite tension on this cable. From this cable a series of steel anchors are suspended by wire-ropes of smaller dimensions at suitable distances, the lengths varying according to the position of each to the catenary curve of the main cable, so that the anchors are all upon a level from one end to the other of the cable-way. The distance from fluke to fluke across the anchors is about 2 feet, and instead of the ordinary points there are sockets by which the steel road-rope is supported and firmly secured. Thus, instead of a railroad or a platform, there are two parallel horizontal wire-ropes maintained by the anchors. The catenary cable is, seemingly, a 3-inch one, and the road-ropes each about an inch in diameter. The breaking strain of the main cable would probably be some hundred and sixty tons, and as the road-ropes relieve rather than add to the strain there should be no misgiving with regard to the strength of the entire structure. The passenger-cars—or rather cages, for they are formed of iron rods and stout wiring—are about 7 feet long and about 5 feet wide, capable of holding eight persons sitting back to back. They are suspended from the two track-way ropes by four pulleys attached to the inwardly-curved ends of the four main rods of the car. Thus the pulley axles are always outside the track-ropes and always at the same distance apart, and the pulleys can never get off the

ropes. This arrangement has also the advantage that no provision has to be made for clearing the supports of the roadway at any point whatever, as the cars pass completely free within the supporting columns. The haulage of the cars on the Dyke line is effected by a $4\frac{1}{2}$ horse-power Crossley's oil engine, which drives a small endless wire-rope on a perpetual horizontal plane, the hauling-rope passing within the curves of the anchors. The car can be gripped to either portion of the hauling-rope, and its course can be controlled on the journey if required. An electric telegraph-wire is permanently provided for communication along the line, available alike to cars and stations. The time occupied in transit between the terminal stations is two and a half minutes.

THE BATHS' CLUB, DOVER STREET, MAYFAIR, W.

THE above club, which will shortly be ready for the reception of members, is novel as far as London is concerned, but in America and Scotland, where similar clubs are in existence, they have become exceedingly popular. The object of the club is to afford its members accommodation for swimming and gymnastics, and also for Russian, Turkish and other baths. The building, which has been erected for the purpose, although not much to look at externally, is magnificently fitted internally, and no expense has been spared in making it a most desirable resort. The Turkish chambers consist of sudatorium, tepidarium, frigidarium, shampooing and washing-rooms, with Russian, plunge, shower, douche, steam douche, wave and sitz baths attached. The spacious bath hall contains the swimming pond, about 75 feet long by 35 feet broad, varying in depth from 3 to 7 feet. Diving-boards are fixed at various heights above the water, and entrance is given to the swimming pond direct from the lavatorium. At one end of the hall the fencing-room and gymnasium are fitted up with all the necessary appliances for gymnastic exercises, in addition to which trapeze travelling rings, flying rings and horizontal bars are suspended over the swimming pond. Suites of dressing-rooms are arranged on one side of the hall. The whole building is comfortably heated and ventilated, the water in the swimming pond being kept pure, and at a temperature of about 65 degrees at all seasons. There is a well-appointed hair-dressing saloon in connection with the baths. Those parts of the buildings which contain the dining, reading, smoking, billiard and bed-

rooms (forty), while communicating with, are distinctly separate from the baths and gymnasium. Special provision is made for breakfasting members who may wish to enjoy the swimming bath in the morning. The building has been erected by Messrs. J. Allen & Son, of Kilburn, and the whole of the laundry machinery has been supplied by Mr. Harper Twelve-trees, of London and Manchester. The total cost of the works has been about 70,000*l.* The architect was Mr. Collins B. Young, of Cockspur Street, and Mr. Donald Milne, clerk of works.

AUCTIONEERS' BENEVOLENT FUND.

THE annual meeting of the Incorporated Auctioneers' Benevolent Fund was held on Monday at the Mart, Tokenhouse Yard, Mr. Daniel Watney (treasurer), presiding. In their report the committee of management stated that the subscriptions for the past year had exceeded those of any previous twelve months, the amount being 322*l.* as against 303*l.* in 1893. A legacy of 100*l.* had been received during the year, which, with a further 150*l.*, had been invested. During the current month the committee would be in a position to allot another annuity of 20*l.*, for which they had already several applications. In moving the adoption of the report, the Chairman said that the committee had approved the principle of the appointment of honorary secretaries for particular counties, large towns and agricultural centres, and a number of gentlemen had consented to act in that capacity. During the ten years of the fund's existence, ending in 1893, the amount of relief given was 2,114*l.*, as compared with 524*l.* in the previous ten years. He was pleased to say that the present year showed that a much larger proportion of pecuniary assistance was being distributed, and he hoped the income would enable them to increase the amount in future. Mr. R. W. Scobell seconded the motion, which was adopted. Mr. H. H. Price (Market Harborough), Mr. C. C. R. Spelman (Norwich), and Mr. Hugh Turner (Ipswich), were elected members of the committee of management.

THE public parks committee of the Edinburgh Town Council have recommended the acceptance of an estimate of between 300*l.* and 400*l.* for the improvement of the Braid ponds, with the object of making them suitable as safety ponds and for other purposes.

ROOFING FELT.

Selly Park
on Birmingham
26th Sept '94

Dear Sir,

If you ask my opinion,
I should strongly recommend
you to use 'The Potter' Roofing
Felt. You know how much
about felt as I do - at any rate,
you will when you know this one
- and then use felt, and felt.
'The Potter' is called after the maker,
Andrew Potter, of Wolverhampton.

Yours truly,
W. P. Palmer

Mr. Wm. Gething.

ELECTRIC LIGHTING AT WORCESTER.

THE Corporation electric-light works at Worcester have been opened. Mr. W. H. Preece was selected as consulting engineer. Tenders were invited for the construction of works and supply of light equal to 12,000 ten candle-power lamps, and fifteen applications were received from some of the leading electricity companies. Worcester is the first town to utilise to any extent the water-power at its doors, for, although the works will be supplied with steam machinery for use in case of flood, the electric current will be chiefly generated by means of turbines placed on the river Teme at Powick, where there is a weir of 12 feet fall. From Powick the current is conveyed underground a distance of three miles to Worcester, and there distributed throughout the city. In addition to lighting the streets and public buildings, electric power is made use of for pumping purposes at the Corporation waterworks, and the Council supply the electric current to private consumers for either motive or lighting purposes at reasonable rates. The light was "switched on" by the Mayor, who afterwards entertained a large company at the Guildhall.

POPLAR PUBLIC LIBRARY.

THE new public library erected by the commissioners for All Saints, Poplar, has been formally opened, having been about a year in progress. The site is in High Street, in the heart of the parish, and is of a good size, so that it has been possible to obtain three important requisites, namely, space on the ground storey for all the parts which are to be used by the public; good lighting by windows, skylights being avoided throughout; and complete quiet for the readers. The library entrance leads into a vaulted hall about 12 feet square; from this the office is entered, and the inner hall is reached through swing doors. Other swing doors lead into the public space of the lending library, 20 feet long by 11 feet wide. Behind the counter are the book-stores, giving room for 35,000 to 40,000 volumes. The upper floor, designed for a part of the book-store, has been omitted for the present, in order to save outlay. The news and reference-rooms are reached from the south end of the inner hall. Each of these rooms will give accommodation for 120 readers, and they are both lighted in the same way, by windows low down on one side and by windows on both sides of a clerestory. The centre portion of the news-room is

22 feet 6 inches high, and the side portions about 11 feet. The staff behind the counter of the lending library can overlook the whole of the public portions of the building, as also the sub-librarian in his glazed enclosure, formed in the corners of news and reference-rooms. Messrs. McCormick & Sons, of Canonbury, were the builders, Mr. Williams being their foreman. Mr. H. G. Rogers was clerk of works. Messrs. Strode & Co. carried out the heating by low-pressure hot water. The gaslighting is by Wenham ventilating lamps, so that the products of combustion are all carried away by iron pipes in the roofs. "Adamant" is used for the internal plastering. The librarian's residence occupies the one and two-pair storeys of the tall central block in front. Messrs. Clarkson, of Great Ormond Street, were the architects to the commissioners.

WORKMEN'S DWELLINGS IN MANCHESTER AND SALFORD.

OF practical questions in social politics we shall, says the *Manchester Guardian*, probably in the municipal elections be most concerned with that dealing with the provision of workmen's dwellings. In Manchester the three great districts of Ancoats, Hulme and Angel Meadow, and in Salford the long and crowded district running north of Chapel Street from the Exchange Station to Regent Road, present as a continual problem for the people how, with small means, to find a suitable dwelling within easy distance of the work-place. In Manchester the Corporation, acting through the sanitary committee, have made a beginning in building workmen's dwellings. In Ancoats, where new "labourers' dwellings" have been and are being built, the primary consideration with them was to remove insanitary cottage property which was a discredit and a menace to the health of the city. The Local Government Board, before sanctioning any interference with this property, demanded that new dwellings should be provided in substitution of those condemned, and that they should be put up within a reasonable distance. The Corporation, so far as their scheme has gone, have really covered anew ground that a twelvemonth ago was littered with decayed shops and old back-to-back cottages. Two schemes are now practically completed—that of "No. 2 Block" in Oldham Road, and that of Pollard Street, further in the rear. "No. 1

Block" in Oldham Road yet remains to be dealt with. The old buildings on it have not yet been pulled down.

The cost of the new dwellings to the city when all the accounts have been made up will, of course, be found considerable. The block of buildings which faces Oldham Road is a great deal the larger of the two completed schemes. It is five storeys high, and besides a row of fourteen shops which extends along its Oldham Road front for 264 feet, it has 284 labourers' dwellings, made up of 236 which are termed "double" and forty-eight "single" dwellings, with other shops at the basement corners. The whole building covers a square bounded by four streets—Oldham Road in the front, Spittal Street and George Leigh Street at the sides, and Bengal Street in the rear. The building runs out and is carried up flush with the pavement on all four sides. This leaves a vacant square in the middle of the ground, the boundary of which is the building itself. The whole square—buildings and playground together—contains 7,800 yards, practically $1\frac{1}{4}$ acre. Of this, three-quarters of an acre is covered with buildings and the remaining acre is that left in the middle as a playground for the children of the people who will occupy the dwellings. The cost of the buildings when finished—they will not be entirely so for a few weeks—will be a little over 50,000*l*. The cost of the land to the Corporation may be reckoned at 5*l*. per square yard, bringing the total cost of the 7,800 square yards on which the Oldham Road dwellings are built to about 90,000*l*. It is in the calculation of the cost of the land, however, that the primary object of the scheme must be considered. As a mere speculation in a site for new dwellings it could scarcely be said that the Corporation had set foot on the most solid of bargains. But other considerations than that of money remain. The insanitary block that covered the ground has been swept away. It should also be remembered that the cost of arbitration and the charges for compensation enlarged the total cost of the land. Half a dozen public-houses had to be bought along with the goodwill of a number of shops, and the worst of buildings have, it is found in arbitration, some kind of monetary value.

In this new departure the question most debated is, naturally enough, whether the plan adopted by the Corporation is the best that could be chosen. It can scarcely be said that superabundant provision has been made for workpeople with families either in the Oldham Road block of buildings or in that in Pollard Street, the latter of which has 135 dwellings, as compared with the 284 in the Oldham Road block. The "double dwellings," which are the largest provided, and of which the

blocks mainly consist, have each no more than two rooms and what is termed a "lobby," the latter being really the passage to the rooms inside the door of the dwellings. The rooms themselves are of good size. The "living-room" is 14 feet 6 inches by 12 feet, and the bedroom 9 feet by 12 feet. All the rooms are 9 feet high. The inside walls are plastered, the lower part painted, and the upper stained. Gas is laid on in the "living-room" on the "penny-in-the-slot" system. A small meter high in one corner of the room has a "slot" similar to that of the universal sweetmeat provider on the platforms of railway stations. You drop a penny in the gas-meter "slot" and are provided with 25 feet of gas—a rate, of course, of 3*s*. 4*d*. per 1,000 feet. The penny-in-the-slot system gives an almost infallible method for discovering the relative values as illuminants of gas and of oil. The calculations of two householders in the dwellings, made on pretty exact observations, went a day or two ago in favour of oil. "I burn oil in part for the eyes and in part for the pocket," said a venerable dame. She had made her reckoning to the hour, and proved by it that "three-haporth" of oil was exactly equal to "four-penorth" of gas. She, however, admitted that "gas is the sweetest thing." This was on account of the bracket, which "set the room off nicely." Of room-fittings, the "double dwellings" are provided with hanging cupboards in the bedrooms. The cooking ranges in the living rooms are better than those usually found in cottages, and there are, as may be supposed, a "sink" and a dresser. The sanitary arrangements, so far as fittings go, are of the best, but there are scarcely enough of them. The system is water-carriage and all the pipes are airtight at the sides and ventilated at the top. Coal-boxes are provided in the passages. One apparent imperfection is the lack of main approaches to the dwellings. No more than four are provided, one at each corner. From each of these steps go up to "balconies" which run right round the outer wall of the building on (the inner side of the square) level with each of the four upper "flats" or storeys. It is difficult to say, after the usual fashion, in what style of architecture the building is designed. The balconies 'despoil it of the appearance on the inner side of the square of a series of warehouses, of which the doors, rising one above another, appear like the "lifts." Possibly the balconies, which are sufficiently wide, will allow of plant or flower culture in pots, otherwise there will be no scrap of green to break the monotony of red brick with red facings of which the whole block is built. The acre of ground which the block encloses is being laid in "granolith," which is a mix-

ture of granite and cement that will form a sound "floor" to the playground. At each of the four corners of the building is an upper storey—really the sixth—each of which contains a wash-house and drying-room. Twenty-four boilers are provided and the drying space in the upper rooms is perhaps sufficient. As yet the wash-houses have been scarcely used. The cost of fuel for a large boiler is considerable, and the stock of washing usually not large.

The rentals of the dwellings do not lean too greatly to the side of cheapness. For the two-room dwellings on the Oldham Road side—of which there are forty-eight—the weekly rent is five shillings. This part of the building has twenty-four "dwellings" of a single room each, of which the rent asked will be three shillings weekly. None of these dwellings are yet out of the hands of the painters—they will be in a few days—so that none of them are yet let. On the Spittal Street side there are fifty-seven "double" dwellings; the weekly rental of each is four shillings. On the George Leigh Street side there are seventy "double" dwellings with rentals of four shillings weekly, and twenty-four single dwellings with rentals of 2s. 6d. weekly; and on the Bengal Street side there are sixty double dwellings with rentals of four shillings weekly. Besides, a deposit of five shillings is required from each householder before he enters on occupation. With this he gives the superintendent who lives on the dwellings a signed application bearing his name, his occupation, his "present address," the number of rooms required in the house, whether he is married or single, the number of children residing with their parents, the ages of the boys, the ages of the girls and also a personal reference. He is then handed a set of rules which, as they number seventeen, are too long to be here set out in full. They provide for a good many possible eventualities, including, if necessary, ejectment at forty-eight hours' notice. Already there are about seventy-five tenants in this Oldham Road building. These chiefly occupy the two-room four-shilling dwellings. Oddly enough they are not in the main drawn from the inhabitants of the Ancoats district, but are from Hulme, Lower Broughton and districts wider of the city, whence workpeople whose occupation is in the city have come to be nearer their employment. Some of the five-shilling houses on the Oldham Road front even have been asked for. It would be scarcely wise to conclude that "barrack life," as it is termed, is popular in Manchester. The supreme consideration is to be near work. "Trams," said one tenant, "cost money, and they take time too." This tenant was an hotel porter. Skilled mechanics, who can

perhaps better afford the money if not the time for a journey home of a mile or two out of the city, do not form a great proportion of the occupiers of such "block dwellings" as we have yet in Manchester and Salford. Warehouse porters, market and street labourers, carmen and men employed in the other thousand and one different ways in shops, factories and warehouses in the centre of the city appear to be of those who are perforce ready to take almost anything that can be got in the way of convenient homes.

In Salford the Corporation have undertaken a scheme which is considerably less ambitious than that of Manchester. They have cleared away some of the insanitary and rickety property behind Greengate, which, shut in here and there by the walls and arches of the Lancashire and Yorkshire Railway, was about as unlovely a spot as the most inveterate of "slummers" could desire to look on. On the cleared space, bounded on the one side by Queen Street and on the other by Rolla Street, they are building a double block of dwellings which, as distinct from the title of "labourers" in Manchester, are here called "artisans' dwellings." The two blocks, with a kind of half-connecting smaller block at one end, will contain sixty-nine dwellings. One advantage they have over those in Manchester. They are no more than three storeys high, and that, in the opinion of those who already occupy houses of the kind, is a distinct gain. In the absence of a "lift," supplies of all kinds, even coal, have to be carried by hand to the top storeys, and these, therefore, usually let at a smaller rental. Otherwise the Salford dwellings are very similar in character to those in Manchester. The floors of the rooms in each instance are of wood, and of the approaches cement, and the sanitary arrangements are excellent. There is a rather larger provision of that kind in the Salford dwellings. The "houses" here also, however, contain no more than two rooms, with the consequence that children must either occupy the same bedroom as their parents, or that the "living-room" must be made to serve a double purpose. Between the two blocks of buildings in Salford, and opening to another street, Collier Street, is an "open court" of good size which will serve as a playground. Another difference between the Manchester and the Salford schemes lies in this—that the Salford block has more approaches, which divide the balconies, and therefore give each house greater seclusion. The washhouses in the Salford blocks are at the end of each "flat" or storey, and one wash-house will serve for the use of about half a dozen dwellings. The outer walls of the two blocks are of grey brick, with red

terra-cotta dressings. Besides the two rooms to each dwelling, in Salford a small scullery of about 5 feet by 5 feet is provided. The living-rooms are 14 feet 3 inches by 13 feet 6 inches, and the bedrooms 13 feet 6 inches by 9 feet. The bedrooms here face the outer streets, while in the Manchester blocks the contrary rule applies, the bedrooms facing the central ground. The cost of the Salford block, so far as the building is concerned, will be about 12,500*l*. As the blocks will not be completed for several weeks, the rentals have not yet been fixed. Here, as in Manchester, the cost of the land, when the total has been reckoned, will be found heavy. Compensation of various kinds is included in the bill.

Of "block" dwellings which have undergone the test of occupation, one of the most interesting is that belonging to the Lancashire and Yorkshire Railway Company in Oldfield Road. The company, in enlarging their line, dispossessed a number of people of their houses, and the block is therefore one of the "compensatory" kind demanded by the Local Government Board. It contains sixty dwellings, arranged on four floors, and has been occupied since April 1893. The principal difference in the accommodation here provided and that of the Manchester and Salford schemes is that the greater number of the dwellings have two bedrooms besides the living-room, complete sanitary appliances, and a separate entrance from the balcony. The "single" houses have one bedroom. The block is well divided by stairs. Gas is supplied on the "penny-in-the-slot" system. The rents are, for the three-roomed houses on the ground and first floor, 3*s*. 9*d*. weekly, two-roomed houses 3*s*. 3*d*. On the two higher floors the rents are 3*s*. 6*d*. for three-roomed houses and 3*s*. for two-roomed houses respectively. These dwellings are now, and for some time have been, full. The tenants belong to the same class of workpeople as those in the Manchester Corporation dwellings. No spare land for "play-grounds" remained on this site, and the roof is therefore laid flat, railed round, and used for that purpose. The washhouses are also built on the roof, but their end would have been better served if the chimneys had been carried higher. The additional value gained by nearness of the dwellings to the men's places of work is shown clearly under the scale of rents paid to the Lancashire and Yorkshire Company. They have, besides the Oldfield Road block, two other smaller blocks near Blackfriars Street—Trinity Buildings and Springfield Buildings. Here the accommodation provided is similar to that in Oldfield Road, but the rents—the houses being nearer the city—reach the higher rate of 4*s*. 6*d*. weekly.

INSANITARY DWELLINGS IN BIRMINGHAM.

At the Birmingham police-court on Friday last an application was made on behalf of the health committee, under Part 2 of the Housing of the Working Classes Act 1890, for orders against the owners of forty-two houses to close the property, on the ground that the houses were in a state so dangerous to health as to be unfit for human habitation.

The first summons was against the trustees of Mason College.—Mr. Bell said he had received a letter from the trustees of the college consenting to a closing order being made, as the house was about to be pulled down.—Dr. Alfred Hill, medical officer of health, said the house was in 21 Court, Lancaster Street. It was in a very dangerous state, the living room having a capacity of only 302 cubic feet, while the bedroom, which was over the washhouse, had a capacity of 840 cubic feet. The house was damp and defective, and unfit for habitation.—The magistrates made the order.

The next summons was against Mr. Thomas Henry Goodwin Newton, Barrells Park, Henley-in-Arden, in respect to six houses in Woodcock Street.—Mr. Chatwin said he appeared for Mr. Newton, and must ask for an adjournment of the cases on the ground that his client was not served with the summonses. Mr. Bell objected to an adjournment on the ground that, as Mr. Newton was served with notices in May last to put the houses in habitable repair, he had had plenty of time to make up his mind what he was going to do in the matter. The houses were damp, defective and dilapidated, and unfit for habitation. Therefore an adjournment would be a serious thing. If the order asked for was granted Mr. Newton could apply for the houses to be reopened if they were put in habitable repair.—Mr. Chatwin said he was informed that extensive repairs had been done by the lessee, and that the property was now in fair tenable condition.—The magistrates granted an adjournment for seven days.

Sir Alfred Sherlock Gooch was summoned in respect to ten houses in Duddleston Row.—Mr. Bell said that Sir Alfred was the freeholder, and therefore the owner against whom the Corporation had to take proceedings, but part of the premises were in the occupation of a leaseholder named Barry, less than twenty-one years of whose lease remained unexpired. Therefore, it was not charged against Sir Alfred that he permitted the premises to get into this dangerous condition. Still, the property was in a damp and dilapidated condition and unfit for habitation.—Mr. H. Young (who represented Sir Alfred

Gooch) said that as his client was not in possession and had no control over the property, he was not in a position to admit that the houses ought to be closed.—Dr. Hill, medical officer of health, said he had examined the houses in No. 3 Court, Duddleston Row. No. 9 was a small house, consisting of two small rooms; the walls were dirty and damp, the floors defective, the ceilings low and filthy, and the roof defective. The house was only 7 feet from the front of No. 2, and therefore obstructive to it. The houses generally had no back doors, but stood back to back, so that ventilation was almost impossible. The houses were dirty and unhealthy. Dr. Hill spoke in detail of each of the ten houses, and said that the whole of them were in a dilapidated condition, and so dangerous to health that they were unfit for human habitation.—Mr. Young said his client was not in receipt of the rents, but he had, in accordance with the 47th section, given notice to the Corporation of the person who was the owner of the rack rents so that the notice might be served on him.—Mr. Bell said that section only referred to cases where there were two owners within the meaning of the Act. Supposing there was a term of twenty-two years outstanding, then under the Act the Corporation would have to serve the leaseholder, and then the freeholder could serve them with notice that he was interested in the property as the freeholder, so that the premises should not be demolished without his knowledge. But there was nothing in the Act which said they must serve the leaseholder with a term of less than twenty-one years unexpired, because that would contradict the 29th section, which said that the owner should be any person except a man having less than twenty-one years of his lease unexpired.—Mr. Young did not agree with Mr. Bell, but the point was immaterial, as his client had given the notice he was required to give. The lease had less than twenty-one years to run, and therefore Sir Alfred Gooch was brought into court, although he had no power to do anything to obviate the nuisance complained of. The Act defined the word "owner," which in this case meant Sir Alfred Gooch, because the lease had less than twenty-one years to run. It said that if the owner was not in the receipt of the rents and profits, he should give notice to the Corporation of such ownership, and that had been done.—Mr. Bell said that Sub-section 1 of Section 47 said:—"Where an owner of any dwelling-house is not the person in receipt of the profits thereof, he may give notice of such ownership to the local authority, and the local authority shall give to such owner notice of any proceedings taken by them." "Such owner,"

however, was not to be the lessee.—Mr. Shirley Smith, who represented the lessee, Mr. John Joseph Barry, was granted permission, although he had no *locus standi*, to address the court. He said his client had not been served with any notice by the Corporation in respect to the application, and therefore if a decision was given which affected his houses it would be without his having had an opportunity of doing sufficient repairs to keep the houses open.—Mr. Carter (magistrates' clerk) said the Act contemplated that being done, for it had been decided that the owner might be summoned over the head of the occupier, although the latter might be liable to do the repairs. That hardship had been contemplated by the Public Health Act.—Mr. Smith: Without notice?—Mr. Carter: Oh yes, without notice.—Mr. Smith said his client did not wish to have insanitary property, but he did not wish to have proceedings taken without his knowledge, or without an opportunity being given him of putting the property in repair.—Mr. Bell said the other side did not offer any evidence that the houses were in a fit state for habitation.—The magistrates granted the order to close the houses.—Mr. Young said his client raised no objection to the houses being closed. His predecessor granted a lease of the property on July 30, 1790, for 107 years, so that about two years remained unexpired. There was no doubt a good deal of the property was in a very dilapidated state, so much so that Sir Alfred Gooch's representatives had been trying unsuccessfully for some time to get possession of the property in order that it might be pulled down or put in a different state more adapted to the requirements of the town than when it was built 107 years ago. But Sir Alfred was powerless in the matter. He was unable to get possession of the property, and had no right to go upon it to do anything himself. Under the lease there were covenants to repair, and his only remedy was to enforce the covenants by an action for damages. At the end of these long leases it was often difficult to find out who was the person really responsible and liable to be sued for breach of the covenants. Sir Alfred offered no objection to the houses being closed, but he wished the magistrates to understand that he was powerless to do anything himself.—Mr. Smith said that when the orders were served his client (the lessee) would have to consider his position.

In the case of the representatives of the Lichfield estate, Mr. Ebenezer Piercy, Great Barr, the trustee, and Mr. Goodwin, solicitor, Cannon Street, who were served with notices respecting four houses in 36 Court, High Street, Deritend, did not

appear.—Evidence was given that the property was unfit for habitation, and orders were made that the houses should be closed.—Mr. J. C. Holder was summoned with reference to two houses in Lancaster Street. Mr. Bell said the summonses would be withdrawn, as the houses had been pulled down.

An application was made to close nine houses in Barford Street, and Mr. William Every, solicitor, Honiton, appeared on behalf of the owners.—Mr. Every said his clients were in the same position as Sir Alfred Gooch. They were the freeholders and powerless to interfere with the property. The property was let in 1787 and 1788 on leases for 117 and 116 years, so that the leases expired in ten years' time.—Dr. Hill, medical officer of health, gave evidence with regard to the condition of the nine houses, which, he said, were built below the street level. The walls and floors were damp and defective, the ceilings were damp and cracked, some of the windows did not open and others only half-way, and the roofs of several of the houses were defective. The houses were certainly unfit for habitation. In reply to Mr. Every, Dr. Hill said the walls of the structures were sound.—The houses were ordered to be closed.

In the case of Margaret Jackson, Oldham, who was summoned in respect of four houses in Summerhill Street, her agent, Benjamin Daubs, Dolobran Road, Sparkbrook, appeared and admitted that the property was in a defective condition, and consented to a closing order being made.—The magistrates granted the order.

The last person summoned was Mr. John Joseph Barry, the owner of six houses in 13 Court, St. George's Street, which the Corporation asked should be closed. Mr. Shirley Smith appeared for Mr. Barry.—Dr. Hill said the houses were in a very dilapidated state when he saw them, and unfit for habitation. Some of the houses were unoccupied and nailed up.—Mr. Smith said the rents of the houses only produced 39s. in July, August and September, and the ground rent was 25s. a year, so that the property would not stand much expense.—Mr. Barry was called, and said that the property was not nearly so bad as represented by Dr. Hill. The houses had been repaired. He admitted, in cross-examination by Mr. Bell, that he was interested in a great deal of dilapidated property. It was not true that a closing order had been made against him in respect to property in Bordesley, but he had applied for an order under the 1875 Act to reopen some property. The application was refused on the first occasion, but that was because he did not know the requirements of the authorities. He proposed to put the whole of the property referred to in St. George's Street in

habitable repair.—Mr. W. F. Newton, architect, said he examined the premises on the previous day, and found them in fairly good condition. In his opinion they were fit for habitation.—The magistrates adjourned the case for fourteen days, in order that they might inspect the property themselves.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

18524. Fred Walsh, for "Improvements in and apparatus for connecting and securing soil-pipes to water-closets."

18535. John Gill, for "Improvements in furnaces for destroying town refuse and the like."

18654. Arthur William Adams, for "Improvements in the construction of bolts, locks, latches, fastenings and stays for casements, sashes, windows, doors and other analogous structures."

18671. Villiers Barrett Lennard, for "Improvements in disinfecting apparatus for use in water-closets, urinals, lavatories and the like."

18672. John MacLachlan, for "Improvements in door latches and locks."

18693. John Fielden, for "An improved chimney-pot."

18732. August Föppel, for "Improvements in the construction of roofs."

18782. Frederick Dakin, for "Improvements in door-closing appliances."

18793. Hugh Kerr, for "Improvements in and relating to windows."

18806. Charles Henry Kitching, for "An improved syphon for water-closet and other suitable cisterns."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND

" 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH

" 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

CONTRACTS OPEN.

ABINGDON.—Nov. 3.—For the Erection of a Library and Reading-room. Mr. J. G. T. West, M.S.A., Abingdon.

ACCRINGTON.—Nov. 13.—For Pulling-down and Rebuilding St. James's Schools. Mr. Bell, 14 Grimshawe Street, Burnley.

ALNWICK.—Nov. 2.—For Erection of Premises. Mr. George Reavell, jun., Architect, Alnwick.

ALNWICK.—Nov. 5.—For Building Five Houses. Mr. M. Temple Wilson, Architect, 69 Narrowgate, Alnwick.

ALVERSTOKE.—Oct. 27.—For Set of Closets for Workhouse. Mr. Harry A. P. Smith, Architect, Star Chambers, Gosport.

BARMOUTH.—Oct. 31.—For the Supply and Erection of Ten Baths for Hot and Cold Sea-water. Mr. Thomas Blackburn, C.E., Barmouth.

BATTERSEA.—Oct. 27.—For Erection of an Additional Swimming-bath and other Works. Mr. Rowland Plumbe, Architect, 13 Fitzroy Square, W.

BELFAST.—Oct. 27.—For Exhibition Buildings. Mr. R. I. Caldwell, 21 Arthur Street, Belfast.

BELFAST.—Nov. 5.—For Building Hospital. Mr. W. J. Fennell, Architect, 11 Chichester Street, Belfast.

BELFAST.—Nov. 8.—For Service Reservoir and Main Conduit. Mr. L. L. Macassey, Engineer, Waterworks Offices, Belfast.

BLACKPOOL.—Oct. 29.—For Church Tower and Spire. Messrs. Walker & Collinson, Architects, 13 Piece Hall Yard, Bradford.

BRISTOL.—Nov. 29.—For Caretaker's House to School. Mr. F. Bligh Bond, Architect, 36 Corn Street, Bristol.

BRIXWORTH.—Oct. 31.—For Tramp Wards at Workhouse. Mr. A. Lewis, Surveyor, Brixworth, Northants.

BROMLEY.—Oct. 30.—For Sewering, Levelling, Paving, Metalling and Channelling Work. Mr. F. H. Norman, Clerk to Local Board, Bromley, Kent.

BURNTWOOD.—Nov. 12.—For the Construction of Additional Wards at Staffordshire County Lunatic Asylum. Mr. Stanger, Queen's Chambers, North Street, Wolverhampton.

BURTON-ON-TRENT.—Oct. 30.—For the Construction of Main Intercepting Sewers. Mr. J. E. Swindlehurst, Borough Surveyor, Burton-on-Trent.

BURTON-ON-TRENT.—Oct. 30.—For the Supply and Delivery of about Thirty Tons of Cast-iron Pipes. Mr. J. E. Swindlehurst, Borough Surveyor, Burton-on-Trent.

CANNOCK.—Nov. 2.—For Enlarging Board-room for Guardians. Messrs. J. R. Veall & Son, Architects, 84 Darlington Street, Wolverhampton.

CARDIFF.—Oct. 31.—For Building Church. Mr. E. G. Halliday, Architect, 14 High Street, Cardiff.

CHARMINSTER, DORSET.—Oct. 31.—For the Erection of a Church. Mr. G. T. Hine, 35 Parliament Street, Westminster.

CHEDDLETON.—Nov. 30.—For Erection of a Lunatic Asylum. Messrs. Giles, Gough & Trollope, Architect, 28 Craven Street, Strand, W.C.

THE "MONOPOL" Fire Extinguisher

FOR MANSIONS, PRIVATE HOUSES, HOTELS, HYDROS, RESTAURANTS, CLUBS, PUBLIC INSTITUTIONS, &c.

MADE IN VARIOUS SIZES.

Light and Portable. The smallest size, which contains Five Gallons, is particularly suitable for extinguishing small outbreaks of Fire. Larger sizes, containing Eight, Ten, and Twelve Gallons, are particularly adapted for Public Institutions, &c. The general appearance of the "MONOPOL" is artistic and strongly built and not likely to get out of order. Architects are invited to specify the "MONOPOL" for the above purposes.

PRICES AND PARTICULARS ON APPLICATION TO

MACINTOSH & CO., Wool Exchange, Coleman St., E.C.

COVENTRY.—Oct. 30.—For the Erection of Mixed and Infant Schools. Messrs. G. & J. Steane, 22 Little Park Street, Coventry.

CROYDON.—Nov. 6.—For Addition of Seven Blocks to Borough Hospital, at Waddon. The Borough Engineer.

CWMBACH.—Oct. 30.—For Two Villas. Mr. T. Roderick, Architect, Aberdare.

SPECIALTIES—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London,"

No. 208. Special thrust motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

RYDE.—Oct. 26.—For Sixteen Hydraulic Pulp Presses for Paperworks. Mr. R. F. Anderson, Engineer, Ryde, Isle of Wight.

SHEFFIELD.—Oct. 29.—For Building Shops and Offices. Messrs. Flockton & Gibbs, Architects, 15 St. James Row, Sheffield.

SHEFFIELD.—Oct. 31.—For the Erection of a Refuse Destructor. Mr. C. F. Wike, C.E., Bower Spring, Sheffield.

SLIGO.—Oct. 3.—For Additions to Lunatic Asylum. Mr. P. J. Tuohy, Custom House, Dublin.

SOUTHAMPTON.—Nov. 2.—For Additions to Oddfellows' Hall. Mr. J. H. Blizzard, Architect, Castle Lane, Southampton.

SOUTH NORMANTON.—Oct. 29.—For Building Infant School. Mr. J. T. Shardlow, Architect, Blyth Road, Worksop.

ST. ANNES.—Oct. 29.—Tower and Spire to Church. Messrs. Walker & Collinson, 13 Piece Hall Yard, Bradford.

ST. AUSTELL.—Oct. 31.—For Building Assembly Rooms. Mr. Silvanus Trevail, Architect, Truro.

TREFOREST.—Nov. 13.—For Extension of Gasworks. Mr. T. Newbigging, Engineer, 5 Norfolk Street, Manchester.

WALTHAMSTOW.—Oct. 26.—For Making-up Streets, Laying Concrete Flags, and Laying Fifteen Granite Cube Crossings. Mr. Geo. W. Holmes, A.M.I.C.E., Town Hall, Walthamstow.

At the meeting of the Burntisland Harbour Commissioners plans were submitted for new deep-water docks at Burntisland, prepared jointly by Messrs. Meik and the harbour engineer. The probable cost of alternative schemes ranged from 200,000l. to 300,000l. Owing to the effects of the strike it was agreed to postpone further proceedings in the matter till another year.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " " " " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " " " " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

TRADE NOTES.

MESSRS. JEFFREYS & Co. write us:—We note that in your article on the Architectural Association's *Conversazione* you mention our exhibit, but say, "contrary to their usual custom, the designers' names were not apparent." We would point out that this is a mistake, as our screens of wall-papers, and also our panels of embossed copper friezes, were ticketed with our cards, on which the names of the designers were distinctly written. Your representative may have only noticed two of our pattern-books, which did not happen to have the designers' names on, but on our principal exhibit we made a point of giving all the designers' names, according to our general custom.

THE church schools, Wrangthorn, Leeds, are being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE are informed that Mr. R. L. Huxtable, of 10 Arthur Street West, E.C., has recently been appointed sole London agent for Messrs. Parkers, Limited, wood mantel and overmantel manufacturers, Birmingham.

FOR some time past a considerable portion of the South Quay wall at Ayr Harbour has been in a dilapidated condition, part of it having tumbled into the river. The harbour trustees have taken in estimates for having the wall rebuilt, and the successful contractors, Messrs. H. Kennedy & Son, Partick, have now commenced work. The extent of wall to be built is 376 yards, and the contract amounts to 21,022*l*.

IT is stated that Messrs. Kynoch & Co., of Birmingham, of which Mr. Arthur Chamberlain, brother of Mr. Joseph Chamberlain, is the managing director, have decided upon the establishment of a cordite factory in Ireland. The firm has lately received an order for 600 tons of cordite from the War Office, and they are about to apply to the Government for sanction to build a factory in the South of Ireland. It is proposed to acquire about 300 acres of land.

IT is proverbial that all work and no recreation has a dulling effect on the best of men. Messrs. W. & G. Ashford, Essex and Kent Streets, Birmingham, has sent us a list of golf clubs and appliances, just issued by them. In it are details as to appliances of every kind, and each kind is shown in so many varieties that it is not easy to see something is not to be found to meet not only individual requirements but even individual idiosyncrasies.

VARIETIES.

A VERY beautiful work has just been printed and published by J. L. Allday, Shakespeare Press, Edmund Street, Birmingham. The value of the work is, however, not to be measured by the price—one shilling—for few would have undertaken to give the public such a publication at, as some would say, so impossibly a small price. The work is entitled "Shakespeare's Stratford: A Pictorial Pilgrimage," by W. Hallsworth Waite. In the preface Mr. H. I. D. Ryder too much depreciates the letterpress, modestly intimating that it must be tolerated, as the letterpress accompanying the work of the artist's pencil stands in the same relation as many a libretto to a musician's opera. It will be found, however, that notwithstanding that it is supposed there is nothing new to be recited about Shakespeare and Stratford, that the public will by perusal find a fund of information that may be unknown to them. Any one who is acquainted with Stratford-on-Avon can testify to the fidelity of the pictures. As to the excellence of the reproduction of the numberless views, we cannot give higher praise than to say the work tells its own tale in that respect.

IN the next number of the *Artist, Photographer and Decorator* will be several important reproductions of Sir E. Burne-Jones's work, and a full-page reproduction of a valuable drawing by Mr. Ruskin, drawn between the years 1843 and 1845, when Mr. Ruskin was occupied upon his "Modern Painters," which is now published for the first time. In an early issue will also commence a series of invaluable reproductions from a sketch-book by Michael Angelo, which has been placed at the disposal of the proprietors by a private collector. These sketches have, up to the present, never been reproduced.

THE *Chester Chronicle*, in regard of the proposed refuse-tip at Sealand, says, at a special meeting of the Town Council, held privately in general purposes committee, it was unanimously decided to purchase 418 acres 2 roods 24 perches of land at Sealand, at a cost of 27,000*l*., without obtaining sanction for a loan.

THE London County Council have decided "That it be referred to the Public Health and Housing Committee to consider and report whether in certain cases the open gratings to the sewers in the public highways constitute such a danger to the public health as to render it desirable that the Council should consider the question of whether a remedy can be provided."

WORKS, ROTHERHAM, Estab. 1854.

THE Great Eastern Railway Company are putting on a fourth steamer, to meet the increasing traffic between Harwich and the Hook of Holland, the *Vienna*, and, like its sister ships, fitted with all latest improvements and a life-belt for every passenger. The new boat is a twin-screw steamer of 1,745 tons and 5,000 indicated horse-power. At a trial 29 knots were covered in 95 minutes, the average hourly speed therefore being a little more than eighteen knots.

THE directors of the London and Lancashire Fire Insurance Co. have declared an interim dividend of 3s. per share (being at the same rate as the last interim dividend), payable on November 7, 1894.

THE surveyor of Worthing has been able to stop the waste of water in the town, which amounted to 197,520 gallons daily.

CLARIDGE'S HOTEL, in Brook Street, is immediately to be given over to the "housebreaker," and to come down. The site has been acquired by a syndicate, and a vast new hotel, built on modern principles, will be erected.

ESTIMATES and plans have been adopted by the Liverpool Corporation library committee for building a library at the north end of the city at a cost of 10,000l.

AN inquiry has been held at Portishead in regard of an application by the Local Board to borrow 14,000l. for works of sewerage and sewage disposal. Mr. T. J. Moss Flower, engineer, designed the scheme.

THE Galashiels Corporation have decided to construct a bridge over the river Gala, to provide direct communication between the east end of the town and the Melrose district.

ELECTRICAL.

IMPROVEMENTS are to be carried out at the Theatre Royal, Leeds. Amongst works which will affect nearly every portion of the auditorium and its approaches, it is proposed to alter to some extent the pit, boxes and circle in order to afford a better view of the stage from these parts of the house. There is also to be an installation of electric light; and a series of automatic sprinklers is to be provided in every part of the building so as to afford greater protection against fire.

ON Tuesday the chairman of the markets and fairs committee (Mr. Parkes) attended at the Market Hall and switched on the electric light, which is to be used for the illumination of the whole of the building.

AN inquiry has been held at the Town Hall, Whitehaven, in reference to the application of the Whitehaven trustees for sanction for power to borrow 6,304l. additional money for electric-lighting works.

WORKS of renovation, extension and improvement of a very extensive character are being carried out on the Duke of Sutherland's Trentham estate, involving an estimated expenditure of 20,000l., and providing employment for upwards of 400 hands. One of the undertakings is the lighting of Trentham Hall by electricity. Water from the Trent, which flows close by the hall, will supply the power for working the dynamos, the waterway having to be deepened and adapted to this purpose.

BUILDING AND BUILDERS.

AT the meeting of the Coventry City Council a memorial was presented from the Coventry and District Master Builders' Association asking for a revision of the building by-laws, with a view to render them more reasonable and workable, as at present they were obnoxious and irksome, and tended to discourage building enterprise.

AT the meeting of the Glasgow Dean of Guild Court plans of the following buildings were passed:—Five tenements of shops and dwelling houses, to be erected in Bain Square, Gallowgate, by the City Improvement Trust; tramway stores to be erected in Pollokshaws Road by the Corporation; tenements of shops and dwelling-houses to be erected at corner of Parliamentary Road and Catherine Street by George Kerr, builder; new sanitary chambers, three storeys in height, and costing 17,500l., to be erected at corner of Montrose Street and Cochrane Street by the Police Commissioners; a two-storey villa in Nithsdale Road, to be erected by George Hamilton, builder, Dumbreck. Sanction was also given for the alteration and extension of the Clydesdale Ironworks, Possilpark.

THE *Birmingham Post* says:—A hitch has occurred in the arrangements for erecting the new meat market and slaughter-houses in Bradford Street. The tenders for the buildings, ten in number, were opened at the meeting of the markets and fairs committee, but in every case the amount of the tender was in excess of the amount (45,000l.) authorised by the Council as the expenditure on this portion of the scheme. The tenders were referred to a sub-committee, with a view to see whether any modifications of the scheme can be adopted to bring the work within the estimate.

HOUSE AT BLACKHEATH.

SUBSIDENCES IN GLASGOW.

AT the sitting of Glasgow Dean of Guild Court, Messrs. Barlas & Murdoch, builders, reported that they had examined two tenements of dwelling-houses situated at Nos. 3 and 5 and No. 9 Glasgow Street, Hillhead. The houses, which are much rent, were examined by Mr. John Whyte, master of works, and a second inspection showing sufficient cause for reasonable apprehension that one of the tenements, which is four storeys in height, was in a dangerous condition, the tenants were ordered to leave. The houses are situated on the south side of Glasgow Street. The subway passes underneath the centre of that thoroughfare. A subsidence had taken place at 227 Argyll Street. The premises are situated on the south side of the street, underneath the Caledonian Railway Bridge. The west side of the window sill has subsided, leaving a space of about 2 inches between the glass and the woodwork underneath, and the brickwork below is out of line to a similar extent. The upper part of the window has been boarded across, and a seam has opened in the sash. The subsidence has been taking place gradually. Mr. John Whyte, master of works, having been informed of the occurrence, made an inspection of the place.

LIVERPOOL MASTER BUILDERS.

THE Liverpool Master Builders' Association have just held their annual meeting at their offices, 6 Lord Street, Mr. J. Sirett Brown, presiding. The report and accounts for the past twelve months were read and adopted, and the officers for the ensuing year were appointed, with Mr. Wm. Hall as president. The

report states that the notices received from the various branches of the building trade for advances in wages, reduction in working hours and alterations in trade rules have all been settled amicably, and that all the trades (with the exception of the masons) are now working to a uniform code of rules. Last autumn notices were received for a reduction of the working hours and an advance in wages from the bricklayers, plasterers, slaters, plumbers and painters, and also from the bricklayers' and plasterers' labourers, and the committee considered this a good opportunity for endeavouring to effect such alterations in the general rules as to make them applicable to all the various branches of the trade. The masons and carpenters and joiners were working virtually the hours the other trades desired, viz. what is popularly called the nine hours' system, but to effect a uniform code of rules it was necessary to serve them with a notice of the proposed new rules, which was done. These rules were drafted by the committee and submitted to a special meeting of the Association and approved of.

THE APPOINTMENT OF CLERK OF WORKS.

AN interesting and important case to architects, surveyors, &c., was heard at Crediton (Devon) County Court on Monday, before Judge Edge. The action was one involving the right of appointment of clerk of works. Mr. S. Hooper, architect and surveyor, Hatherleigh, claimed 6*l.* 16*s.* 6*d.* from Bow (Devon) School Board, balance due on a bill in respect of work in connection with the erection of new classrooms at Bow. Mr. G. Hooper, Dane's Inn, W.C., appeared for plaintiff; Mr. Pope for defendants.

Mr. Hooper said in April last year the defendants, who were members of the Bow and Nymet Tracey School Board, wrote to Mr. S. Hooper, asking him to visit Bow to prepare plans and superintend work in connection with erection of new classrooms. The result was that the work was carried out under plaintiff's supervision, agreement being that he should be paid on same lines as for previous professional services. When the work was completed, plaintiff sent in his bill for the total charge of 25*l.* The Board repudiated one of the items, but Mr. Hooper declined to go into the question with them, on the ground that he was practically an arbitrator. The Board consulted a firm of solicitors, who took the same line, and offered to pay the account less 10*l.* Plaintiff
